

CONTENTS

Part 1	Page
Chapter 1 INTRODUCTION. Principles of prestressed concrete. Advantages of prestressed concrete. Economics of prestressed concrete. Principles of design. General methods of prestressing. Types of prestressed concrete.	
Chapter 2 MATERIALS. Types of steel. Strength of prestressing steel. Stress-strain relationship. Resistance to fatigue. Creep and relaxation. Effect of high temperatures. Effect of low temperatures. Corrosion of prestressing steel. Concrete. Type of cement and mix. Strength of concrete. Compressive strength. Tensile strength. Relation between strength and modulus of elasticity. Relationship between stress and strain. Shrinkage and creep. Prediction of shrinkage and creep. Effect of high temperature. Effect of low temperature. Movements due to temperature changes. Durability of concrete. Admixtures. Structural lightweight concrete.	11
Chapter 3 BEHAVIOUR OF PRESTRESSED CONCRETE BEAMS. Deformation of reinforced and prestressed concrete beams. Cracking. Development of cracks. Failure. Sections with well-bonded steel. Sections with non-bonded steel. Resistance to shear. Resistance to fatigue. Resistance to impact. Effects of vibration. Resistance to earthquakes. Sustained loading. Resistance to fire. Corrosion and durability.	45
Chapter 4 TYPES OF PRESTRESSING STEEL. Prestressing tendons. Wires, strands and bars for pre-tensioning. Tendons for post-tensioning. Bars for post-tensioning. Anchoring prestressing steel. Efficiency of anchors.	63
Chapter 5 CRITERIA FOR ANALYSIS AND DESIGN. The essential loading stages. The limit-state approach. The magnitude of the prestress and the prestressing force. Notation. Permissible stresses in concrete. Permissible compressive stress at transfer. Compressive stresses permissible at working load. Tensile stresses permissible at working load. Temporary tensile stresses	

	at transfer and during transport. Principal tensile stresses. Permissible stress in bending in concrete at ultimate load. Stress in steel. Stress permissible in steel at transfer and working load. Stress due to bending permissible in steel at ultimate load. Permissible stresses in reinforcement resisting shearing. Stresses permissible in composite members. Other criteria for local damage. Deflection. Cracking. Load factors. General recommendations.	74
Chapter 6	LOSSES OF PRESTRESSING FORCE. Introduction. Loss of stress between the jack and the anchorage. Elastic shortening. Pre-tensioned steel. Post-tensioned steel. General considerations. Losses due to shrinkage and creep of concrete. Losses due to relaxation of the steel. Losses due to friction. Reverse friction. Pre-tensioned steel. Losses due to non-tensioned steel. Losses due to other causes. Combined losses. The total losses. Losses with pre-tensioning. Losses with post-tensioning.	94
Chapter 7	ANALYSIS OF STRESSES. Determination of elastic stresses in a homogeneous member. Stresses due to prestressing force and weight of member. Stresses due to prestressing force only. Combined stresses due to prestressing force and weight of member. Stresses due to working load. Stresses due to direct load. Concentric load. Eccentric load. Combined stresses due to bending and direct compressive load. Stresses due to shearing only. Stresses due to shearing and bending. Stresses due to torsion. St Venant torsion. Warping torsion: St Venants theory. Combined stresses due to torsion and bending. Combined bending and shear. The determination of flexural stresses at failure. Equilibrium of ultimate forces (strains ignored). Equilibrium of ultimate strains. The determination of shearing strength. Shear strength of cracked section. Torsion.	126
Chapter 8	GENERAL DESIGN OF PRESTRESSED MEMBERS. General design considerations. General remarks. Design concept. Various methods of design. Outline of design procedure. Selection of trial section. Positions and area of steel. Secondary checks. Comments. Ultimate (collapse) load design. Design for working load (elastic conditions). Application of general formulae to particular cases. Rectangular sections. Sections symmetrical about two axes. Sections unsymmetrical about horizontal axis – I and box sections. Sections with tensioned steel at both faces. Minimum section. Section with enlarged compressive zone. Oversized section. Special cases. Position of prestressing steel. Stress conditions at the ends of beams. Combined criteria for ultimate load and service load. Simple design. Combined criteria. Sections subjected to reversal of bending moments. Design of sections unsymmetrical about vertical axis.	157

CONTENTS

- Chapter 9 **EXAMPLES OF FLEXURAL DESIGN.** Recommendations, of CP 115, CP 116, CP 110 and CEB. Simply supported beam with pre-tensioned steel. Roof beam with post-tensioned steel. Warehouse floor units. Warehouse floor units with straight and deflected pre-tensioned steel. Beam of varying cross-section. Limit state of collapse condition. General notes on the design of simply supported long-span precast beams. 188
- Chapter 10 **END BLOCKS.** Post-tensioned steel. General Calculation of stresses. Linear distribution of prestressing force. Non-linear distribution of prestressing force. Magnel's method. Guyon's method. Resultant stresses. Zielinski and Rowe's method. Morsch's method. Bearing stresses under anchorage plates. Pre-tensioned steel. Transmission length. Transmission zone. 245
- Chapter 11 **COMPOSITE MEMBERS.** General principle. Historical development. Analysis and design of composite sections. Design of composite members. Losses of prestress. Horizontal shear at interface. Warehouse floor units. Propped composite floor. Composite floor without props. Differential shrinkage. 272
- Chapter 12 **DEFLECTION.** General notes. Unsymmetrical load. Variation of deflection with time. Design for no camber. Effect of variation in position of prestressing steel. Composite floor propped during construction. Effect of creep. Composite member without props. 316
- Chapter 13 **OTHER DESIGN CONSIDERATIONS.** Bending-up of cables. General principles. Beams of uniform cross-section. Beams of varying cross-section. Shearing and stirrups. Stability problems. General notes. The basic theory. Lateral stability. Dynamic instability as a consequence of resonance. Instability of building construction due to insufficient connection between pre-cast members. Special thin-walled members. Fulfilment of design assumptions. Specification and drawings. 325
- Chapter 14 **STATICALLY-INDETERMINATE STRUCTURES.** General notes. Secondary bending moments. Analysis of statically-indeterminate structures. Three and four moment theorem. Degree of indeterminacy. Symmetry and negative symmetry. Closed-frame structures. Sign convention. Applications to prestressed concrete. General. Concordant cables. Beam with one end fixed. Beam with both ends fixed. Continuous beam. The law of linear transformation. Selection of cable profile. Calculation of secondary bending moments. Beams with fixed ends. Continuous beams. Single-bay frames. Effect of horizontal reactions on prestressing force. Continuity with pre-cast elements. 343
- Chapter 15 **APPLICATIONS OF PRESTRESSING.** Structural members in building. Floors. Roofs. Trusses. Arches. Bridges. Road Bridges. Long-span bridges. Footbridges. Columns and struts.

CONTENTS/ACKNOWLEDGEMENTS

Masts. Piles. Stresses. General notes. Piles in the earthquake zone. Sheet piles. Fender piles. Anchor piles. Shells. Advantages of prestressing. Domes. Cylindrical shells. North-light shell roofs. Hyperbolic paraboloids. Folded slabs. Pipes and tanks.

Chapter 16 **DESIGN FOR FIRE RESISTANCE.** General considerations. Methods of dimensioning prestressed concrete members for a definite fire resistance rating. Design based on tests. Dimensioning on the basis of tables. Design of restrained beams. Fire resistance and insurance premiums.

Chapter 17 **SPECIFICATION**

Appendix **DESIGN PHILOSOPHY.** Ten principles. Standardization – suitability – economy. Safety – simplicity – economy. Philosophy of design. Engineer – architect – contractor. Prefabrication versus concrete in place. Statically indeterminate structures. Limit-state design.
