CHAPTER 1 – CONVENTIONAL LIQUID HYDROCARBON FUELS	1
Crude oils and their refining	1
Chemistry and constituents of crude oil	2
1.1 Alkanes, olefins, alkenes and alkynes	2
1.2 Octane and heptane	3
1.3 Cyclo-alkanes	4
1.4 The aromatics	5
The products of distillation of crude oils	6
1.5 LPG, gasoline, kerosine, DERV, oils and waxes	6
Processing the distilled products	7
1.6 Thermal, catalytic and hydro-cracking	7
1.7 Catalytic reforming	8
CHAPTER 2 – PROPERTIES OF CONVENTIONAL FUELS	10
2.1 Properties of gasoline	10
Performance criteria	12
2.2 Pre-ignition, detonation and octane number	12
2.3 Boiling point and vapour lock	14
2.4 Carburettor icing	15
2.5 Fuel composition	16
Additives	17
2.6 The functions and origins of additives	17
2.7 Lead compounds	17
2.8 Alternatives to lead – oxygenates	18
2.9 Anti-oxidants	19
2.10 Detergent and anti-icing additives	20
2.11 Driveability, spark aiders and alcohol blends	20
CHAPTER 3 – ALTERNATIVE ENGINES AND FUELS, INCLUDING FOR RACING	22
Alternative power units	22
3.1 Merritt MCC and Stirling engines, gas turbines and electric power	22
Potential alternative fuels	24
3.2 Liquid, liquefied gases and gaseous fuels	24
3.3 Operation on LPG	26
3.4 Alternative sources and production processes	27
3.5 Energy content	28
3.6 Hydrogen as a fuel	29
3.7 Metal hydrides as an alternative fuel source	30
3.8 Liquid hydrides	30
3.9 Prospects for gaseous fuels	31
3.10 Fuels from coal	31
3.11 Racing fuels and additives	32

CHAPTER 4 – FUEL TANKS AND THE MEASUREMENT OF THEIR CONTENTS

	34
Fuel tanks	34
4.1 Sizes of tanks	34
4.2 Fuel tank evolution	35
4.3 Factors affecting tank position	35
Corrosion and design	36
4.4 Tank construction	36
4.5 Filling and venting requirements	38
4.6 Venting in practice	39
4.7 Filler necks	43
Plastics tanks	44
4.8 History, design requirements and testing	44
4.9 Evaporative emissions	45
4.10 Plastics tank materials and design	47
4.11 Plastics tank production	48
4.12 Meeting evaporative emissions requirements	49
4.13 A simple non-toxic barrier sealing process	49
4.14 Method of lamination of Selar RB	50
4.15 Advantages of laminar barrier technique	51
4.16 Plastics tank construction and assembly	51
4.17 The advantages of plastics tanks	53
Inside fuel tanks	54
4.18 Connections, drainage, instrumentation and surge pots	54
4.19 Some recent developments	54
4.20 Special requirements for fuel injection systems	56
4.21 Fuel contents gauging	57
4.22 Swinging arm type sensor	57
4.23 Float tube type sensor	59
4.24 A compound sensor	60
4.25 The electro thermal sensor	60

CHAPTER 5 – TRANSFERRING THE FUEL FROM TANK TO METERING UNIT

	61
Plastics pipes, fuel rails	62
5.1 Requirements for elastomeric pipes	62
5.2 Plastics materials	62
5.3 Pipe connections	65
5.4 Fuel rails	67
Filters	69
5.5 Fuel filtration	69
Pumps	72
5.6 Fuel lift	72
5.7 Mechanical positive displacement fuel lift pumps	73
5.8 Electrical positive displacement fuel lift pumps	77
5.9 Requirements for pumps in fuel injection systems	79
5.10 A rotary displacement pump	81
5.11 Some other rotary fuel lift pumps	83

CHAPTER 6 – THE FUNDAMENTAL PRINCIPLES OF CARBURATION	85
Requirements and history	85
6.1 The functions of a carburettor	85
6.2 Some early carburettors	86
Engine control and volumetric efficiency	88
6.3 Breathing and ingestion of the air-fuel mixture	88
6.4 Volumetric efficiency	90
Metering practice and theory	90
6.5 Basis of metering fuel and air	90
6.6 Essential elements of a carburation system	91
6.7 The gas flow	92
6.8 Fuel flow	93
6.9 Velocity of flow	94
6.10 Mass flow	95
6.11 The flow constants	95
CHAPTER 7 – ELEMENTS OF CARBURETTORS	98
The components	99
7.1 The float chamber	99
7.2 The venturi	102
7.3 The multiple venturi	104
7.4 A carburettor with simple compensation	105
7.5 The spray tube	108
7.6 Evaporation of the fuel into the air stream	110
Specific requirements	110
7.7 Requirements for starting, idling and acceleration	110
7.8 Idling and slow running devices	111
7.9 Cold starting, manual chokes or stranglers	113
7.10 Automatic chokes	114
7.11 Auxiliary starting carburettor	116
7.12 Zenith Auto-Starter	117
Acceleration and power enrichment devices and electronic control	119
7.13 Enrichment for acceleration	119
7.14 Static devices for acceleration enrichment	121
7.15 Acceleration pumps	122
7.16 Enrichment for maximum power	124
7.17 Electronically controlled carburation	126
CHAPTER 8 – CONSTANT DEPRESSION AND FIXED VENTURI CARBURETTORS IN PRACTICE	128
Constant depression types	128
8.1 The constant depression type carburettor	128
8.2 Mixture strength characteristics – fixed and variable venturis	129
8.3 The SU carburettors	131
8.4 Reduction of exhaust emissions	132
8.5 The Zenith Stromberg constant depression carburettors	136
A sidedraught constant depression carburettor	140
8.6 The Ford VV carburettor	140

8.7	Float chamber and main jet	141
8.8	Idling system	142
8.9	Acceleration	144
8.10	Cold start and warm-up	145
	Fixed choke carburettors	147
8.11	Weber TL Series single barrel fixed choke carburettors	147
8.12	Idling system	148
8.13	Main jet	151
8.14	Power jet and accelerator pump	152
8.15	Cold starting	154
	Multiple and multi-barrel carburettors	155
8.16	Carburettor installations for larger engines	155
8.17	Twin-barrel carburettors	157
	Electronic control	158
8.18	An electronically controlled 4-barrel carburettor	158
8.19	Starting and idling	160
8.20	Ports for ancillary functions	162
8.21	The solenoid control mechanism	162
8.22	The main metering system	162
8.23	Secondary system	164
8.24	Acceleration pump	166
8.25	Automatic strangler control	167
CHAPTER 9 – INDUCTION MANIFOLD DESIGN		169
	Fundamental considerations	170
9.1	Mixture distribution	170
9.2	Some general design considerations	170
9.3	Manifolds as evaporation chambers	171
9.4	Manifold heating	172
9.5	Exhaust heated hot spots in practice	173
9.6	Manifold shapes and sizes	174
9.7	Effect of inlet valve operation	176
	Layouts	177
9.8	Twin-cylinder engines	177
9.9	Three cylinders	178
9.10	Four-cylinder in-line engines	181
9.11	Six-cylinder in-line engines	182
9.12	Eight cylinders	184
9.13	The V-layouts	186
	Induction system tuning	188
9.14	A tuned manifold for an injected engine	188
9.15	The Dual Ram concept in detail	191
9.16	Three-stage throttle for injected systems	192
CHAPTER 10 – LPG FUEL AND MIXING SYSTEMS		194
	Engine design considerations	194
10.1	Engine modifications	194
	LPG equipment	196
10.2	LPG systems	196

10.3	The LPG tank	197
10.4	The mixing unit	199
10.5	Delivering the fuel from the tank	200
10.6	The vaporiser	200
10.7	The pressure regulator	203
10.8	Pressure regulation for idling and starting	204
	Electronic control	205
10.9	Landi Hartog LH II Autogas System	205
10.10	Operation	209
10.11	The Landi Lambda control	211

CHAPTER 11 – GASOLINE INJECTION 212

	Types of injection system	213
11.1	Which injection system?	213
11.2	Where to inject	214
11.3	The alternatives	215
	Closed loop control	217
11.4	The lambda sensor	217
	The Bosch systems	219
11.5	The Bosch hydraulic, electro-hydraulic and electronic systems	219
11.6	Elements of modern injection systems	222
	Air flow metering	222
11.7	Air flow sensors	222
11.8	Suspended plate type air flow meter	224
11.9	Swinging gate type air flow meter	225
11.10	Hot wire anemometer	228
	Fuel flow metering	230
11.11	Continuous flow systems	230
11.12	Fuel metering in the KE-Jetronic continuous flow system	234
11.13	The KE-Jetronic pressure regulator	235
11.14	The electro-hydraulic pressure regulator	237
11.15	Fuel distribution in the KE-Jetronic system	238
11.16	Fuel metering with intermittent or timed injection	240
11.17	Fuel metering controls of the L- and LH-Jetronic systems	241
11.18	Cold starting and idling	244
11.19	The auxiliary air device	245
11.20	Idling speed regulation and warm-up	247
11.21	Enrichment for acceleration	250
11.22	Full load enrichment	250
	Injectors	252
11.23	Some aspects of injector design	252
11.24	Injector firing strategies	253
11.25	The Lucas injector	253
11.26	Deposits in nozzles	255
11.27	Some other injectors	256
11.28	Start valves	259
	Throttle body injection	260
11.29	Bosch Mono-Jetronic system	260
11.30	Mono-Jetronic control and operation	262

Fuel injection and engine management	263
11.31 Bosch Motronic combined fuel injection and ignition system	263
11.32 Electronic ignition control in the Motronic system	263
11.33 Motronic fuel supply system	267
11.34 Overall principle of operation of the Motronic system	267
11.35 Other variables	271
Some other systems	273
11.36 The GM Multec single-point system	273
11.37 The Multec multi-point system	275
11.38 Weber IAW injection-ignition system	277

CHAPTER 12 – COMBUSTION AND COMBUSTION CHAMBERS

The Merritt concept	281
12.1 Catalytic ignition	281
12.2 The MCC catalytic combustion system	282
Flame development with electric ignition	285
12.3 Spark ignition	285
12.4 The flame kernel	285
12.5 Spark timing and compression ratio	286
12.6 Compression ratio and detonation	286
12.7 Air:fuel ratio	288
Mixing the fuel and air	288
12.8 Mixture formation	288
12.9 Swirl and turbulence	290
12.10 Macro turbulence, squish and micro turbulence	291
12.11 Influence of combustion chamber shape	292
Filling the cylinders	294
12.12 Valve layout	294
12.13 Influence of number and size of valves	296
12.14 Influence of valve timing	298
Stratification	299
12.15 The stratified charge concept	299
12.16 Some single chamber systems	300
12.17 The dual chamber principle	302

CHAPTER 13 – EMISSIONS AND THEIR CONTROL

13.1 The greenhouse effect	304
Toxicity	305
13.2 The precise nature of the toxicity	305
13.3 Products of combustion	306
Emission control	306
13.4 Historical development of control measures	306
13.5 The first steps	307
13.6 Early solutions to the problems	308
13.7 Lean burn or catalytic conversion?	309
13.8 Two-way catalytic converters	311
13.9 Three-way conversion	314

Catalytic converter construction	314
13.10 Ceramic monoliths	314
13.11 Catalytic converter control	315
13.12 Metallic monoliths for catalytic converters	315
13.13 Practical considerations	318
Converter control valves	319
13.14 Air management valves	319
13.15 Two-valve and integral valve systems	324
Operational and other considerations	330
13.16 Mixture control and driveability	330
13.17 Heating the incoming air	331
13.18 Engine design factors	331
13.19 Exhaust gas recirculation (EGR)	332
13.20 Reduction of emissions during idling	335
13.21 The gulp valve	336
Evaporative emissions	337
13.22 Sources of evaporative emissions	337
13.23 Crankcase breather valves	338
13.24 Carbon canisters	339
13.25 Open bottom type	339
13.26 Closed bottom type	341
13.27 Canister control valves	342
CHAPTER 14 – SAMPLING AND ANALYSIS OF EMISSIONS	344
Test philosophies	344
14.1 Types of test	344
14.2 General principles of the tests	346
14.3 Sampling and test sequences	347
The test cycles	348
14.4 The FTP 75 test cycle	348
14.5 The EEC and EC test cycle	349
14.6 Japanese test cycle	350
Methods of analysis	351
14.7 Some equipment used	352
