PART ONE THE FOURIER TRANSFORM

I	MATHEMATICAL REVIEW	3
I	Review of Algebra	3
1.1	Sets	3
1.2	Functions	5
1.3	Laws of algebra. Internal laws	6
1.4	Laws of algebra. External laws	8
1.5	Vector space (for the field C of complex numbers)	8
1.6	Linear functions	9
1.7	Order relations	11
II	Concepts from Topology	12
1.8	Sequences of rational numbers	12
1.9	A theorem for monotonic sequences	15
1.10	The concept of distance and the norm	16
1.11	Mappings from one metric space to another	17
1.12	Limits of functions	18
III	Theory of Integration	20
1.13	Preliminary remarks	20
1.14	Construction of the Daniell integral	20
1.15	Identification of elements of L with numerical functions	23
1.16	Elementary properties of the integral	24
1.17	Sequence of integrals	25
1.18	Concept of a primitive. Integration by parts	26
1.19	Multiple integrals. Theorem of Fubini	27
1.20	Integrals over a noncompact interval	28
1.21	Integrals depending upon a parameter	30
1.22	The spaces L^p	31
	Conclusions	33

2	FOURIER TRANSFORMS OF SUMMABLE FUNCTIONS	34
	I Definitions and General Properties	34
	2.1 Definition and notation	34
	2.2 Elementary properties	35
	2.3 Riemann-Lebesgue lemma	38
	2.4 Continuity of the transform	39
	2.5 Differentiability of the transform	39
	2.6 The case in which f has an amplitude-summable derivative	41
	II Reciprocity of the Transform	43
	2.7 Conditions for the existence of the inverse transform	43
	III Convolution Theory	47
	2.8 Definition	47
	2.9 Some special cases	48
	2.10 Remarks	49
	IV Examples	50
	2.11 Examples of direct and inverse transforms	50
3	FOURIER TRANSFORMS FOR SQUARE-SUMMABLE FUNCTIONS	55
	I Definition and properties of the FT in L^2	55
	3.1 The Fourier transform for square-summable functions	55
	3.2 Properties of the transform	58
	3.3 Return to the first definition of the FT	59
	3.4 Convolution	60
	II Scalar Product of Two Functions	61
	3.5 Definition	61
	3.6 Properties of the scalar product	62
	III Example	63
	3.7 Example of FT in L^2 . The Hermite polynomials	63
4	ELEMENTARY THEORY OF MODIFIED DISTRIBUTIONS AND THE DEFINITION OF THEIR FOURIER TRANSFORM	68
	4.1 Introduction to distributions	68
	4.2 Definition of distributions	70
	4.3 FT of modified distributions	72
	4.4 Elementary properties of distributions	75
	4.5 Properties of the FT for distributions	77
	4.6 Differentiation of distributions	80
	4.7 Differentiation of discontinuous functions	82
	4.8 Special distributions	85
	4.9 The FT of functions of S and locally summable functions	86
	4.10 Example of a distribution. Systems of heavy point masses	87
	4.11 Direct product of two distributions	90
	4.12 Convolution product of distributions	90
	4.13 Properties of the convolution product	92
	4.14 Fourier series	97
	4.15 Summary	102

5	THE FOURIER TRANSFORM AND DISTRIBUTIONS IN MULTIDIMENSIONAL SPACE	105
5.1	Notation	105
5.2	The FT of functions in a space of n dimensions	106
5.3	Distributions in a multidimensional space	110
5.4	Differentiation of discontinuous functions	111
5.5	Convolution	115
5.6	Direct product of two distributions	116
5.7	Radial functions or distributions	117
5.8	The nature of modified distributions	123

PART TWO EXAMPLES OF APPLICATIONS OF THE FOURIER TRANSFORM

6	DIFFRACTION AT INFINITY	127
6.1	Reduction of problems of diffraction at infinity to a Fourier transform	127
6.2	Elementary properties of the correspondence between a diffracting pupil and a diffraction figure	128
6.3	The appearance of the distributions	131
6.4	Relation between diffraction and interference phenomena	133
6.5	The convolution product	134
6.6	Application of Fourier series	135
6.7	Imaging with coherent light	137
6.8	Interferometry in optics and radio astronomy	139
6.9	Interferometry in spectroscopy	142

7	COMPLEX IMPEDANCES AND THE FOURIER TRANSFORM IN THE COMPLEX PLANE	145
7.1	Sinusoidal alternating currents and the concept of complex impedance	145
7.2	Use of negative frequencies	147
7.3	General theorems about the complex impedance	149
7.4	Applications: Use of the FT for transient problems	159
7.5	Connection with the Laplace transform	166
7.6	The concept of an analytic signal	168
	Conclusion	172

8	THE FOURIER TRANSFORM IN MATHEMATICAL PHYSICS	173
	A Detailed Study of a Partial Differential Equation	173
8.1	The wave equation in a homogeneous medium and its general solution	173

8.2 Fresnel diffraction	176
8.3 The equations of convolution	190
8.4 General method for the solution of nonhomogeneous equations	191
8.5 Determination of solutions in a section of space. Limiting conditions	194
8.6 A one-dimensional problem	195
8.7 A three-dimensional problem	197
8.8 Green's formula	201

PART THREE LINEAR FILTERS

9 GENERAL PROPERTIES OF FUNCTIONS WHOSE FOURIER TRANSFORM COVERS AN INTERVAL OF FINITE LENGTH 205

9.1 Linear filters in physics	205
9.2 Bernstein's theorem. Derivatives of limited-spectrum functions	214
9.3 Bernstein's theorem in a two-dimensional space	217
9.4 Some applications of Bernstein's theorem	218
9.5 Theorem of interpolation	224

10 RESOLVING POWER THEORY 229

10.1 Physical introduction	229
10.2 Approximation by the mean square difference	231
10.3 Insufficiency of the criterion of the mean square difference	235
10.4 Objects formed from points	235
10.5 A general method of studying the local difference between object and image	239
10.6 Usual procedures of studying the difference	240
10.7 Mathematical results	244
10.8 The role of the various parameters	245
10.9 Localization of the approximation	246
10.10 Saturation of the approximation	248
10.11 Relations between $g(x)$ and the filtering function	250
10.12 The Fourier procedure	253
10.13 The procedure of Féjer	254
10.14 An alternate procedure	256
10.15 General remarks	257

11 THE FOURIER TRANSFORM OF PROBABILITY FUNCTIONS, THE AUTOCORRELATION FUNCTION, AND THE SPECTRAL DISTRIBUTION OF ENERGY 260

11.1 Introduction. The problem of background noise	260
11.2 The autocorrelation function and the spectral distribution of energy	262
11.3 Properties of the autocorrelation function and the spectral distribution of energy	267

11.4 Physical significance of the spectral distribution of energy	269
✓11.5 Random functions of the second order.	272
11.6 Discussion of a specific example. The sensitivity of the interferometric method in radio astronomy	276

PART FOUR NUMERICAL CONSIDERATIONS

12	NUMERICAL METHODS	285
12.1	Problems involving the numerical calculation of Fourier transforms	285
12.2	The formula of Poisson	287
12.3	Calculation of the value of the FT	289
12.4	Calculation of a FT in the presence of background noise	294
12.5	The numerical calculation of certain definite integrals	298
12.6	Practical calculation of a FT	301
12.7	The approximation of a function by a series of translations	303
12.8	Applications	305
12.9	General remarks	309
	BIBLIOGRAPHY	311
	INDEX	315
