Contents

Introduction 3

2. Kinds of Probability 6
   2.1 Bayesians 8
   2.2 Compromises Between Bayesian and Non-Bayesian Methods 10

3. Simple Sampling 12
   3.1 The Estimation of p 15
   3.2 Bayesian Methods of Estimating p 5

4. Multiple Sampling 21
   4.1 Multinomial Estimation 23
   4.2 Natural Groupings of the Categories 30

5 Multinomial Discrimination and Significance 31
   5.1 Discrimination Between Two Simple Statistical Hypotheses 31
   5.2 Bayes/Non-Bayes Compromises 34
   5.3 Estimation of a Flattening Constant and Tests of Equiprobability 35
   5.4 Discrimination Between Two Populations When the Basic Samples are Finite or Infinite 41

5.5 Special Cases of the Discrimination Proble 46

(Tests for Independence in Contingency Table 4

6.1 Row and Column Totals Irrelevant: a More Acceptable Approach 51

6.2 Example of an *Ad Hoc* Method for a Large Sparse Table 55

Large Pure Contingency Tables 5

7.1 Correlated Rows and Columns and Weighte Lumping 58

7.2 Application of "Botryology" to Weighted Lum ing 60

7.3 The Singular Decomposition of a Contingenc Table 61

7.4 A Sequence of Hypotheses for the Cell Probabil ties 63

The Sampling of Species 6

Multidimensional Population Contingenc Tables 7

Summar 7

Appendix A The Incompatibility of Fiducial an Bayesian Inference 8

Appendix I Hausdorff Summation as a Mont Carlo Process 8

Appendix C Folded Contingency Table 8

Appendix I A Minimax Property of Singula Values of a Matrix 8

Appendix I Learning from Experience in th Treatment of Contingency Tables 9
