

CONTENTS

PREFACE

1 INTRODUCTION TO LINEAR PROGRAMMING

- 1.1 Optimization problems
- 1.2 A note on operations research
- 1.3 Deterministic and probabilistic models
- 1.4 Mathematical programming problems
- 1.5 Linear programs
- 1.6 Some sample formulations
- 1.7 The geometry of linear programming
- 1.8 Outline of the text

Exercises

2 MATHEMATICAL BACKGROUND

- 2.1 Prerequisites
- 2.2 Linear algebra assumed
- 2.3 Simultaneous linear equations
- 2.4 Hyperplanes and convex sets
- 2.5 Some additional definitions

Exercises

3	DUALITY THEORY	47
3.1	An example of dual linear programs	47
3.2	The role of duality	50
3.3	Canonical form of the linear program	50
3.4	Transformations to canonical form	51
3.5	Standard form and transformations to it	54
3.6	The dual problem	55
3.7	Some properties of primal and dual problems	62
3.8	The duality theorem	64
3.9	Economic interpretation of primal and dual	69
3.10	The existence theorem	75
3.11	Complementary slackness	
	Exercises	82
4	THE SIMPLEX METHOD	89
4.1	Introduction to the method	89
4.2	Extreme points and basic feasible solutions	90
4.3	Desirable properties of a solution method	94
4.4	Existence of a basic feasible solution	95
4.5	Definitions	99
4.6	Increasing the objective value: the optimality theorem	101
4.7	Pivoting to a new basic feasible solution	106
4.8	Computational procedures	110
4.9	Degeneracy and convergence of the simplex method	118
4.10	Uniqueness and multiple optima	120
4.11	Minimization problems	121
4.12	Economic interpretation of the simplex method	122
4.13	Two remarks	124
	Exercises	125
5	THE TWO-PHASE ALGORITHM AND THE REVISED SIMPLEX METHOD	131
5.1	Desirable adjuncts to the simplex method	131
5.2	Phase 1: the initial basic feasible solution	133
5.3	The redundant constraints	137
5.4	Artificial variables in phase 2	139
5.5	Summary	141
5.6	Further remarks on the two-phase method	145
5.7	A one-phase method for solving linear programs	147
5.8	The revised simplex method	149
5.9	Summary	152
5.10	Revised versus standard simplex	155
	Exercises	158

6	ILLUSTRATIVE CASE PROBLEMS	163
6.1	Linear problems in a nonlinear world	163
6.2	Resource allocation	164
6.3	The diet problem	168
6.4	Machine scheduling	169
6.5	The transportation problem	173
6.6	Job training	178
6.7	An investment problem	181
6.8	A minimax strategy	184
6.9	Production and inventory planning	185
	Exercises	194
7	THE DUAL SIMPLEX METHOD AND POSTOPTIMALITY PROBLEMS	197
7.1	Introduction and motivation	197
7.2	The associated dual solution	199
7.3	The dual simplex method	203
7.4	Summary	209
7.5	Postoptimality problems	212
7.6	Problems involving discrete parameter changes	213
7.7	Problems involving continuous parameter changes	220
7.8	Problems involving structural changes	230
	Exercises	233
8	THE TRANSPORTATION PROBLEM	239
8.1	The problem in its basic context	239
8.2	Alternate formats and variations	241
8.3	Mathematical properties of the transportation problem	244
8.4	The transportation tableau	248
8.5	Loops and linear dependence	251
8.6	The initial basic feasible solution	254
8.7	The transportation algorithm: the reduced costs	260
8.8	The transportation algorithm: pivoting to a new BFS	263
8.9	Summary	267
8.10	Computational remarks	271
8.11	Network flow theory	272
	Exercises	272
