Author's Preface	11
List of Symbols	13

Chapter 1 Deformation and Stress

1.1 Stress	18
1.2 Strain and strain rate	21
1.2.1 Linear strain	22
1.2.2 Simple shear strain	23
1.2.3 Rate of strain	24
1.3 Types of rheological behaviour in simple shear	25
1.3.1 Simple rheological models	26
1.3.2 Time effects during flow	35
1.4 Analysis of stress and strain	40
1.4.1 Further consideration of stress	40
1.4.2 Further consideration of strain	46
1.4.3 Stress-strain relationships	48
1.5 Miscellaneous rheological techniques	55
1.5.1 High pressure rheometry	55
1.5.2 Surface rheometry	55
1.5.3 Strain and flow birefringence	55
1.5.4 Drag reduction	56
1.5.5 Microrheology	56
References	56

Chapter 2 Tube Viscometers

2.1 An ideal tube viscometer	60
2.1.1 Behaviour of model fluids	63
2.1.2 Evaluation of flow curves of unknown form	66
2.1.3 Treatment of experimental results	67

2.2	End effects	69
2.2.1	Kinetic energy correction	69
2.2.2	Couette correction.	70
2.2.3	Stored elastic energy	73
2.2.4	Plunger friction.	73
2.2.5	Barrel correction.	73
2.2.6	Exit pressure discontinuity	74
2.3	Turbulence and other non-steady flows	75
2.3.1	Reynolds turbulence	75
2.3.2	Structural turbulence.	76
2.3.3	Surface roughness during extrusion.	77
2.4	Temperature and pressure variations along a tube	81
2.5	Wall effects	82
2.6	Particle migration	84
2.7	Instrument design	86
2.7.1	Hydrostatic head viscometers.	87
2.7.2	Gas pressure viscometers.	89
2.7.3	Piston viscometers.	92
2.7.4	Tube filling viscometers	95
2.8	Slit viscometers.	98
2.9	Elastic liquids	100
2.9.1	Flow in the viscometric region	100
2.9.2	Flow in the exit region.	101
	References	107

Chapter 3 Rotational Viscometers

3.1	Determination of flow curves in ideal instruments	115
3.1.1	Concentric cylinder viscometers	115
3.1.2	Cone and plate viscometers	129
3.1.3	Double cone-plate viscometers	131
3.1.4	Cone-cone viscometers	134
3.1.5	Plate-plate and disc viscometers	135
3.2	End effects and edge effects	136
3.2.1	Concentric cylinder viscometers	138
3.2.2	Cone-plate and plate-plate viscometers	143
3.3	Departures from circular streamlines	144
3.4	Temperature rise due to shearing	147
3.4.1	Concentric cylinder viscometers	148
3.4.2	Cone and plate viscometers	153
3.5	Wall effects	155
3.6	Instrument design	157
3.6.1	Torque measurement	158
3.6.2	Temperature control	165

3.6.3	Location and alignment of rotating components	167
3.6.4	Speed measurement and control.	169
3.6.5	Complete instruments	170
3.7	Direct measurement of velocity gradient	174
3.8	Normal stress measurements	177
3.8.1	General principles	177
3.8.2	Experimental methods	182
	References	187

Chapter 4 Creep and Stress Relaxation

4.1	Specimen shapes and specimen holders	194
4.1.1	Tensile tests	195
4.1.2	Compression tests	197
4.1.3	Bending tests	198
4.1.4	Tests in simple shear	200
4.1.5	Torsion tests.	203
4.2	Creep tests	204
4.2.1	Constant stress measurements	209
4.2.2	Strain measurement	215
4.3	Stress relaxation measurements	217
4.3.1	Relaxation after sudden strain	217
4.3.2	Relaxation after steady shearing.	220
4.4	Constant strain rate tests.	221
4.4.1	Uniaxial tests	222
4.4.2	Transient stresses in simple shear	224
4.5	Analysis of deformation	226
4.5.1	Compression of thin discs	226
4.5.2	Bending of beams	229
4.5.3	Torsion of rods	235
4.5.4	Correlation of results	236
	References	239

Chapter 5 Dynamic Tests

5.1	Dynamic compliances and moduli.	244
5.2	Classification of test methods	251
5.3	Non-resonant oscillations due to an applied force	258
5.3.1	Methods using two transducers	258
5.3.2	Single transducer methods.	267
5.4	Resonant oscillations	270
5.5	Applied displacement methods.	272
5.6	Free vibration methods.	279
5.6.1	Theory	279

5.6.2	Simple torsion pendulum methods	283
5.6.3	Inverted torsion pendulum methods	284
5.6.4	Calibration of torsion pendula	288
5.7	New rheometers	290
5.7.1	The orthogonal rheometer.	292
5.7.2	The balance rheometer	299
5.7.3	Other new rheometer geometries	301
5.8	Nonlinear behaviour.	302
	References	304

Chapter 6 Wave Propagation

6.1	Introduction.	309
6.2	Shear waves	310
6.2.1	Semi-infinite medium.	313
6.2.2	Fixed surface parallel to driving plate	318
6.2.3	Reflection at a boundary between two media	323
6.3	Longitudinal waves in extended media.	326
6.4	Travelling waves in rods	328
6.4.1	Torsional waves.	328
6.4.2	Longitudinal waves	329
6.4.3	Flexural waves	331
6.5	Resonances in rods	333
6.5.1	Torsional and longitudinal resonance: single rods.	333
6.5.2	Composite rods.	337
6.5.3	Flexural resonance.	340
6.6	Shear waves with cylindrical symmetry	344
6.7	Measurement of velocity and attenuation using continuous waves.	346
6.7.1	Thin strips and fibres	346
6.7.2	Liquids	348
6.8	Resonance methods	350
6.8.1	Free-free vibration of rods: tight coupling.	351
6.8.2	Free-free vibration of rods: loose coupling	354
6.8.3	Vibration of end-clamped rods	358
6.8.4	Miscellaneous resonance methods for solids	359
6.8.5	Resonance methods for liquids.	360
6.9	Pulse methods.	361
6.10	Reflection coefficient methods using pulses	366
6.10.1	Normal incidence	367
6.10.2	Oblique incidence	368
6.11	Characteristic impedance measurements.	369
6.11.1	Audiofrequency impedance methods.	370
6.11.2	High-frequency impedance methods	376
6.12	Very high frequencies and amplitudes	379

6.12.1	Very-high-frequency methods	379
6.12.2	High-amplitude methods.	380
References	381

Chapter 7 Analysis of Viscoelasticity Measurements

7.1	Creep	386
7.2	Mechanical and electrical analogues.	391
7.2.1	Mechanical models.	391
7.2.2	Electrical models.	397
7.3	Stress relaxation	398
7.4	A memory function.	399
7.5	Dynamic measurements	402
7.6	The determination of distribution functions.	404
7.7	Time-temperature superposition	410

Appendix: Commercially Available Apparatus

Table A1	Steady rotation instruments	422
Table A2	Tube viscometers.	423
Table A3	Dynamic test apparatus	424
Table A4	Tension and compression test apparatus.	425
Table A5	Addresses of manufacturers.	426
