

Preface	xi
Authors	xiii
1 Introductory concepts	1
1.1 Notation, conventions, and symbology	1
1.2 The field concept of electromagnetics	2
1.2.1 Historical perspective	2
1.2.2 Formalization of field theory	4
1.3 The sources of the electromagnetic field	5
1.3.1 Macroscopic electromagnetics	6
1.3.2 Impressed vs. secondary sources	9
1.3.3 Surface and line source densities	10
1.3.4 Charge conservation	12
1.3.5 Magnetic charge	17
1.4 Problems	18
2 Maxwell's theory of electromagnetism	19
2.1 The postulate	19
2.1.1 The Maxwell–Minkowski equations	20
2.1.2 Connection to mechanics	23
2.2 The well-posed nature of the postulate	23
2.2.1 Uniqueness of solutions to Maxwell's equations	25
2.2.2 Constitutive relations	27
2.3 Maxwell's equations in moving frames	34
2.3.1 Field conversions under Galilean transformation	35
2.3.2 Field conversions under Lorentz transformation	38
2.4 The Maxwell–Boffi equations	44
2.5 Large-scale form of Maxwell's equations	48
2.5.1 Surface moving with constant velocity	48
2.5.2 Moving, deforming surfaces	55
2.5.3 Large-scale form of the Boffi equations	56
2.6 The nature of the four field quantities	57
2.7 Maxwell's equations with magnetic sources	59
2.8 Boundary (jump) conditions	61
2.8.1 Boundary conditions across a stationary, thin source layer	61
2.8.2 Boundary conditions across a stationary layer of field discontinuity	63
2.8.3 Boundary conditions at the surface of a perfect conductor	67
2.8.4 Boundary conditions across a stationary layer of field discontinuity using equivalent sources	67

	2.8.5	Boundary conditions across a moving layer of field discontinuity	68
2.9		Fundamental theorems	69
	2.9.1	Linearity	69
	2.9.2	Duality	70
	2.9.3	Reciprocity	73
	2.9.4	Similitude	75
	2.9.5	Conservation theorems	76
2.10		The wave nature of the electromagnetic field	88
	2.10.1	Electromagnetic waves	88
	2.10.2	Wave equation for bianisotropic materials	89
	2.10.3	Wave equation in a conducting medium	91
	2.10.4	Scalar wave equation for a conducting medium	92
	2.10.5	Fields determined by Maxwell's equations vs. fields determined by the wave equation	92
	2.10.6	Transient uniform plane waves in a conducting medium	93
	2.10.7	Propagation of cylindrical waves in a lossless medium	100
	2.10.8	Propagation of spherical waves in a lossless medium	103
	2.10.9	Nonradiating sources	106
2.11		Problems	108
3		The static electromagnetic field	115
3.1		Static fields and steady currents	115
	3.1.1	Decoupling of the electric and magnetic fields	116
	3.1.2	Static field equilibrium and conductors	117
	3.1.3	Steady current	119
3.2		Electrostatics	121
	3.2.1	The electrostatic potential and work	121
	3.2.2	Boundary conditions	123
	3.2.3	Uniqueness of the electrostatic field	125
	3.2.4	Poisson's and Laplace's equations	126
	3.2.5	Force and energy	140
	3.2.6	Multipole expansion	144
	3.2.7	Field produced by a permanently polarized body	150
	3.2.8	Potential of a dipole layer	151
	3.2.9	Behavior of electric charge density near a conducting edge	153
	3.2.10	Solution to Laplace's equation for bodies immersed in an im- pressed field	155
3.3		Magnetostatics	157
	3.3.1	The magnetic vector potential	159
	3.3.2	Multipole expansion	162
	3.3.3	Boundary conditions for the magnetostatic field	165
	3.3.4	Uniqueness of the magnetostatic field	166
	3.3.5	Integral solution for the vector potential	167
	3.3.6	Force and energy	170
	3.3.7	Magnetic field of a permanently magnetized body	178
	3.3.8	Bodies immersed in an impressed magnetic field: magnetostatic shielding	181
3.4		Static field theorems	182
	3.4.1	Mean value theorem of electrostatics	182
	3.4.2	Earnshaw's theorem	182

3.4.3	Thomson's theorem	183
3.4.4	Green's reciprocity theorem	184
3.5	Problems	186
4	Temporal and spatial frequency domain representation	195
4.1	Interpretation of the temporal transform	195
4.2	The frequency-domain Maxwell equations	196
4.3	Boundary conditions on the frequency-domain fields	197
4.4	The constitutive and Kronig–Kramers relations	198
4.4.1	The complex permittivity	199
4.4.2	High and low frequency behavior of constitutive parameters	200
4.4.3	The Kronig–Kramers relations	200
4.5	Dissipated and stored energy in a dispersive medium	204
4.5.1	Dissipation in a dispersive material	205
4.5.2	Energy stored in a dispersive material	208
4.5.3	The energy theorem	212
4.6	Some simple models for constitutive parameters	213
4.6.1	Complex permittivity of a non-magnetized plasma	213
4.6.2	Complex dyadic permittivity of a magnetized plasma	218
4.6.3	Simple models of dielectrics	220
4.6.4	Permittivity and conductivity of a conductor	233
4.6.5	Permeability dyadic of a ferrite	233
4.7	Monochromatic fields and the phasor domain	238
4.7.1	The time-harmonic EM fields and constitutive relations	239
4.7.2	The phasor fields and Maxwell's equations	240
4.7.3	Boundary conditions on the phasor fields	241
4.8	Poynting's theorem for time-harmonic fields	241
4.8.1	General form of Poynting's theorem	242
4.8.2	Poynting's theorem for nondispersive materials	243
4.8.3	Lossless, lossy, and active media	245
4.9	The complex Poynting theorem	247
4.9.1	Boundary condition for the time-average Poynting vector	249
4.10	Fundamental theorems for time-harmonic fields	249
4.10.1	Uniqueness	249
4.10.2	Reciprocity revisited	252
4.10.3	Duality	255
4.11	The wave nature of the time-harmonic EM field	258
4.11.1	The frequency-domain wave equation	258
4.11.2	Field relationships and the wave equation for two-dimensional fields	259
4.11.3	Plane waves in a homogeneous, isotropic, lossy material	262
4.11.4	Monochromatic plane waves in a lossy medium	273
4.11.5	Plane waves in layered media	284
4.11.6	Plane-wave propagation in an anisotropic ferrite medium	304
4.11.7	Propagation of cylindrical waves	308
4.11.8	Propagation of spherical waves in a conducting medium	325
4.11.9	Nonradiating sources	328
4.12	Interpretation of the spatial transform	329
4.13	Spatial Fourier decomposition	331
4.13.1	Boundary value problems using the spatial Fourier representation	336

4.14	Periodic fields and Floquet's theorem	345
4.14.1	Floquet's theorem	345
4.14.2	Examples of periodic systems	346
4.15	Problems	350
5	Field decompositions and the EM potentials	357
5.1	Spatial symmetry decompositions	357
5.1.1	Planar field symmetry	357
5.2	Solenoidal-lamellar decomposition	362
5.2.1	Solution for potentials in an unbounded medium: the retarded potentials	372
5.2.2	Solution for potential functions in a bounded medium	382
5.3	Transverse-longitudinal decomposition	384
5.3.1	Transverse-longitudinal decomposition in terms of fields	384
5.4	TE-TM decomposition	387
5.4.1	TE-TM decomposition in terms of fields	387
5.4.2	TE-TM decomposition in terms of Hertzian potentials	388
5.4.3	Application: hollow-pipe waveguides	390
5.4.4	TE-TM decomposition in spherical coordinates	400
5.5	Problems	409
6	Integral solutions of Maxwell's equations	415
6.1	Vector Kirchhoff solution	415
6.1.1	The Stratton-Chu formula	415
6.1.2	The Sommerfeld radiation condition	419
6.1.3	Fields in the excluded region: the extinction theorem	420
6.2	Fields in an unbounded medium	421
6.2.1	The far-zone fields produced by sources in unbounded space	423
6.3	Fields in a bounded, source-free region	428
6.3.1	The vector Huygens principle	428
6.3.2	The Franz formula	429
6.3.3	Love's equivalence principle	430
6.3.4	The Schelkunoff equivalence principle	432
6.3.5	Far-zone fields produced by equivalent sources	433
6.4	Problems	436
7	Integral equations in electromagnetics	439
7.1	A brief overview of integral equations	439
7.1.1	Classification of integral equations	439
7.1.2	Analytic solution of integral equations	441
7.1.3	Numerical solution of integral equations	441
7.1.4	The Method of Moments (MoM)	442
7.1.5	Writing a boundary value problem as an integral equation	445
7.1.6	How integral equations arise in electromagnetics	448
7.2	Plane-wave reflection from an inhomogeneous region	450
7.3	Solution to problems involving thin wires	457
7.3.1	The straight wire	457
7.3.1.1	Derivation of the electric-field integral equation	458
7.3.1.2	Solution to the electric field integral equation	461
7.3.1.3	Impressed field models for antennas	464

7.3.1.4	Impressed field models for scatterers	469
7.3.2	Curved wires	474
7.3.2.1	Pocklington equation for curved wires	474
7.3.2.2	Hallén equation for curved wires	477
7.3.2.3	Example — the circular loop antenna	479
7.3.3	Singularity expansion method for a straight wire	484
7.3.3.1	Integral equation for natural frequencies and modal current distributions	486
7.3.3.2	Numerical solution for natural-mode current	488
7.3.4	Time-domain integral equations for a straight wire	495
7.3.4.1	Time-domain Hallén equation	496
7.3.4.2	Approximate solution for the early-time current	497
7.4	Solution to problems involving two-dimensional conductors	499
7.4.1	The two-dimensional Green's function	500
7.4.2	Scattering by a conducting strip	502
7.4.2.1	TM polarization	502
7.4.2.2	Physical optics approximation for the current and RCS of a strip — TM case	505
7.4.2.3	Numerical results	506
7.4.3	TE polarization	506
7.4.3.1	Physical optics approximation for the current and RCS of a strip — TE case	511
7.4.3.2	Numerical results	511
7.4.4	Scattering by a resistive strip	511
7.4.4.1	Numerical results	514
7.4.5	Cutoff wavenumbers of hollow-pipe waveguides	514
7.4.6	Scattering by a conducting cylinder	524
7.4.6.1	TM polarization — EFIE	527
7.4.6.2	TE polarization — EFIE	530
7.4.6.3	TE polarization — MFIE	535
7.5	Scattering by a penetrable cylinder	541
7.6	Problems	549
A	Mathematical appendix	559
A.1	The Fourier transform	559
A.2	Vector transport theorems	582
A.3	Dyadic analysis	587
A.4	Boundary value problems	592
B	Useful identities	623
C	Some Fourier transform pairs	629
D	Coordinate systems	631
E	Properties of special functions	639
E.1	Bessel functions	639
E.2	Legendre functions	645
E.3	Spherical harmonics	649

F Derivation of an integral identity	653
References	655
Index	667
