Preface	v
Foreword	vii

Chapter 1 CW and pulsed nmr. A general description

1.1 Introduction	1
1.2 The time dependence of the nuclear magnetization	2
1.3 H_1 continuous	5
1.4 H_1 pulsed	6
1.5 Time domain, frequency domain and the Fourier transform	10
References	13

Chapter 2 The role of the computer

2.1 Data input	15
2.2 Sampling	17
2.3 Memory and measurement	19
2.4 Data manipulation	19
References	26

Chapter 3 Spectrometer operation

3.1 Locking	27
3.2 Decoupling	29
3.3 Measuring the spectrum—practical considerations	39
3.4 Problems	56
References	60

Chapter 4 Spin lattice relaxation times

4.1 Mechanism and significance	62
4.2 Measurement	65
4.3 T_1 applications	69
References	74

Chapter 5 Commonly occurring non-routine problems

5.1 The suppression of solvent resonances	76
5.2 Shiftless relaxation reagents	79
5.3 Fourier transform difference spectroscopy	80
References	82

Chapter 6 "New nuclei". A bonus in the solution of chemical problems

6.1 Carbon-13. The advantage of spectral simplicity	85
6.2 Correlation of ^{13}C chemical shifts with structural parameters	94
6.3 Nitrogen-15	104
6.4 Phosphorus-31	108
6.5 "Other" nuclei	115
References	116

Chapter 7 Dynamics and reaction mechanisms

7.1 Rate processes	119
7.2 Reaction intermediates	128
References	130
Appendix A Comments on chemical shifts of nuclei other than ^1H	132
Appendix B Signal assignment in carbon nmr	135
Appendix C The relationship between τ_c and T_1 for spin lattice relaxation mechanisms other than dipole-dipole	139
Appendix D Comments on quadrature detection	140
References	141
Answers to Problems	142
Subject Index	143
