PART I. Particle Physics	1
1. RECENT DEVELOPMENTS IN QUANTUM ELECTRODYNAMICS	3
Kenneth Johnson	
Introduction	5
1. Maxwell Equations - Quantization Formalism	6
2. Sources	8
3. Electromagnetic Field Green's Functions	13
4. Electron Green's Function. Functional Differential Equations	21
5. Functional Equations for $S(x, y)$	29
6. Gauge With a Finite Z_2	34
7. The Electron Bare Mass	43
8. Symmetry Breaking	50
9. Vacuum Polarization	57
10. The Implications of Renormalized Perturbation Theory Concerning Finiteness of the Unrenormalized Field Theory	68
Appendix A	75
Appendix B	78
Appendix C	82
References	85
2. THE FIELD THEORETICAL APPROACH TO COMPOSITE PARTICLES	87
Bernard Jouvét	
1. The Concept of Composite Particle	89
2. The Definition of the Composite Character	95
3. Observable Properties of the Composite Character	117
3.1. The Elastic Case	117
3.2. Effect of Weak Inelasticity on Composite Particles	132

4. Generalization of the Compositeness Equations to the Case of Many Particles With the Same Quantum numbers	157
4.1. Elementary Case	159
4.2. Case of Total Compositeness	164
4.3. Degenerate Cases	166
5. The Mass Equations and the Different Types of Composite Particles	176
6. Allo-Composite Relativistic Particles	200
7. Theory of Auto-Composite Fields	236
7.1. "Oedipien" Case	237
7.2. "Gigogne" Fields	249
Epilogue: A Particle Theocracy?	255

3. GAUGE INVARIANCE WITH NON ZERO PHOTON BARE MASS (Seminar) Bernard Jouvét	257
---	-----

4. ALGEBRAS IN HADRON PHYSICS Yuval Ne'eman	273
Introduction	275
1. Unitary Symmetry. $SU(3)$	276
1.1. The Theory	276
1.2. The Abstract Algebra	279
2. Unitary Symmetry. Physical Applications	291
2.1. Assignments	291
2.2. Intensity Rules	294
2.3. Breaking $SU(3)$	295
3. Current-Generated Algebras, $SU(6)$ Structures and Superconvergence	299
3.1. The Chiral $[U(3) \times U(3)]_{15}$	299
3.2. $SU(6)$, Relativity and Unitarity	302
3.3. Sum Rules	307
4. The Dynamical High Energy Algebra $[U(3) \times U(3)]_8$	313
References	323

	<u>Page</u>
5. INTRODUCTION TO CURRENT ALGEBRA	327
Michael Nauenberg	
Introduction	329
1. Current, Charges and Equal Time Commutators	330
2. Form Factors and Current Conservation	335
3. Parity, Charge Conjugation and Time Reversal Transformation Properties of the Currents	338
4. Pole Dominance of the Divergence of the Axial Vector Current	341
5. Renormalization of the Axial Vector Coupling Constant: the Adler-Weisberger Relation, and the Pion Nucleon Scattering Lengths	348
6. Semi-Leptonic K-Decays	358
7. Dispersion Relation Techniques. Gradient of the δ -Function in the Equal Time Current-Current Commutators	366
8. Tests of Equal Time Current-Current Commutation Relations	375
References	381
6. K_{e4} DECAY AND π-π SCATTERING (Seminar)	383
Alexander Maksymowicz	
7. INFINITE COMPONENT FIELD THEORIES	393
Christian Fronsdal	
1. Review of the Basic Ideas and Successes of SU(6)	395
1.1. Introduction	395
1.2. Tensor Representation of SU(6)	398
1.3. The Two Physical Multiplets	401
2. Experimental Predictions of SU(6)	406
2.1. Mass Relations	406
2.2. Invariant Vertices	408
2.3. Currents and Generators	409
2.4. Non-Static SU(6)	411

	<u>Page</u>
3. The Representations of the Poincaré Group	412
3.1. Introduction	412
3.2. The Structure of the Poincaré Group	413
3.3. Irreducible Representations	414
3.4. The Local Representation	418
4. Some Representations of $SO(f, 1)$	420
4.1. The Analytical Method	420
4.2. Multiplier Representations	422
4.3. The Algebraic Method	423
4.4. Generalized Tensors	425
5. Partial Waves and the Relativistic S-Matrix	429
5.1. Introduction	429
5.2. Direct Partial Waves	430
5.3. Crossed Partial Waves at Nonzero Momentum Transfer	433
5.4. Crossed Partial Waves at Vanishing Momentum Transfer	438
6. Crossed Partial Waves in Non-Relativistic Potential Scattering, and in Classical Relativistic Mechanics	441
6.1. The Classical Limit	441
6.2. The Non-Relativistic Limit	443
8. EXACT RELATIVISTIC $SU(6)$	449
Roscoe White	
1. Introduction	451
2. The Structure of the Symmetry Algebra	452
3. $SL(6, C)$ - Subgroups and Representations	457
3.1. Subgroups	457
3.2. Representations	460
3.3. Reduction with Respect to $SU(6)$	461
4. Physical Properties of the Invariants: Form Factors	464
4.1. The Electric Charge Form Factor	465
4.2. The Baryon-Baryon-Meson Vertex	466
4.3. Crossing Symmetry in Infinite Component Theories	467
References	470

PART II. Nuclear Physics	471
9. SOME PROBLEMS IN FAST NEUTRON PHYSICS Ivo Šlaus and Guy Paić	473
1. Introduction	475
1.1. Nucleon-Nucleon Interaction	482
1.2. Few Nucleon Systems	484
1.3. Nuclear Spectroscopy	489
1.4. Reaction Mechanisms and Nucleon- Nucleus Interaction	490
1.5. Neutron Physics and Other Fields	492
2. Neutron Sources	494
2.1. Radioactive Neutron Sources	495
2.2. Reactors	497
2.3. Production of Neutrons Using Charged Particle Accelerators	497
2.4. Nuclear Explosions	520
2.5. Neutron in the Stars	523
3. Philosophy of the Approach to the Detection of Reaction Products in Neutron Induced Processes	525
3.1. Counter Telescopes	527
4. Polarization of Neutrons	542
4.1. Some Remarks About Experimental Techniques	542
4.2. Neutron Polarization in Various Reactions	544
5. The Study of Multiparticle Breakup Reactions and the Neutron-Neutron Interaction	547
5.1. Multiparticle Reactions	547
5.2. Neutron-Neutron Interaction	560
6. Reaction Mechanisms and Nuclear Spectroscopy	564
6.1. Direct Reactions	564
7. Future of Fast Neutron Physics	589
References	594

	<u>Page</u>
PART III. Solid State Physics	601
10. ELECTRODYNAMICS OF SOLIDS	603
Sergio Rodriguez	
1. Motion of an Electron in a Periodic Potential	605
2. The Tight-Binding Approximation	610
3. Free Electron Approximation	615
4. The Fermi Surface	618
5. Motion of Bloch Electrons in an External Electric Field	624
6. Motion of Electrons in a Magnetic Field	626
7. Cyclotron Resonance	630
8. Propagation of Acoustic Waves in Metals	647
References	671
11. THE ELECTRONIC STRUCTURE AND OPTICAL PROPERTIES OF INSULATORS	673
R. F. Wood	
1. Introduction	675
2. Determinantal Wave Functions and the Hartree-Fock Approximation	676
3. Band Theory	685
4. Review of the Theory of Excitons	700
5. Many-Body Effects	707
6. Optical Absorption Spectra and Their Interpretation	714
7. Point Defects in Ionic Crystals	718
8. Lattice Relaxation and Luminescence	725
References	733

12. ELECTRONIC OPTICAL PROPERTIES OF SOLIDS	737
Manuel Cardona	
Introduction	739
Dielectric Constant of a Solid	741
Free-Carrier (Intraband) Effects	755
Faraday Rotation	761
Voigt Effect	762
Magnetoplasma Reflection	763
Free-Carrier Piezobirrefringence	764
Free-Carrier Interband Effects	764
Interband Effects (Direct Transitions)	765
Long-Wavelength Electronic dielectric Constant of an Insulator (Penn)	777
Experimental Methods	784
Identification of Critical Points	788
ϵ_r and ϵ_i Calculations from Band Structure	794
Modulation Techniques	795
Appendix A	809
Appendix B	810
Appendix C	811
Table I	812
Table II	813
References	816
13. A MEASUREMENT OF THE FINE STRUCTURE CONSTANT BY LEVEL CROSSING IN ATOMIC HYDROGEN (Seminar)	821
Harold Metcalf, John Brandenberger, James Baird	
14. CRITICAL PHENOMENA IN HEISENBERG MODELS OF MAGNETISM (Seminar)	831
H. E. Stanley	
1. Spin Correlation Function	835
2. Classical Heisenberg Model	837
3. Possible Phase Transition in two Dimensions	838
4. Critical Behavior of the Zero-Field Susceptibility	841
References	842
