

Chapter 1 Atomic Structure	
1-1 Rutherford's Experiments and a Model for Atomic Structure	2
1-2 Atomic Number and Atomic Mass	4
1-3 Nuclear Structure	4
1-4 Bohr Theory of the Hydrogen Atom	5
1-5 Absorption and Emission Spectra of Atomic Hydrogen	9
1-6 Ionization Energy of Atomic Hydrogen	15
1-7 General Bohr Theory for a One-Electron Atom	15
The need for a better theory 16	
1-8 Matter Waves	17
1-9 The Uncertainty Principle	18
1-10 Atomic Orbitals	20
1-11 The Wave Equation and Quantum Numbers for the Hydrogen Atom	21
Quantum number specification of orbitals 24	
1-12 Many-electron Atoms	34
Chapter 2 Electronic Properties of Atoms and Molecules	41
2-1 Lewis Structures for Atoms	42
2-2 Effective Atomic Radii in Molecules	43
2-3 Ionization Energies and Orbital Configurations	44
2-4 Electron Affinity	48
2-5 Covalent Bonding	50
Hydrogen molecule-ion 51	
2-6 Properties of H_2 and H_2^+ in a Magnetic Field	52
2-7 Lewis Structures for Diatomic Molecules	52
2-8 Ionic Bonding	53
2-9 Electronegativity	55
2-10 A Covalent Bond with Ionic Character; The HCl Molecule	57
2-11 Lewis Structures for Polyatomic Molecules	58
Carbon tetrachloride molecule 58 · Ammonia molecule 59 · Magnesium chloride, an ionic molecule 59 · Ammonium chloride molecule 60	
2-12 Molecules with Double and Triple Bonds	60
2-13 Bonding to Heavier Atoms	62
2-14 Resonance	64
Chapter 3 Diatomic Molecules	
3-1 Molecules with 1s Valence Atomic Orbitals	71
Net bonding 74	
3-2 Molecules with s and p Valence Atomic Orbitals	77
Sigma orbitals 77 · Pi orbitals 80 · s-p Sigma hybridization 81	
3-3 Homonuclear Diatomic Molecules	85
Lithium 85 · Beryllium 85 · Boron 85 · Carbon 87 · Nitrogen 87 · Oxygen 88 · Fluorine 88 · Neon 88	

3-4	Homonuclear Diatomic Molecules with $n > 2$ Valence Orbitals Na ₂ , K ₂ , Rb ₂ , and Cs ₂ 89 · Cl ₂ , Br ₂ , and I ₂ 89	89
3-5	Hydrogen Fluoride Molecule Dipole moment of HF 94	90
3-6	A General <i>AB</i> Heteronuclear Diatomic Molecule BN (eight valence electrons) 96 · BO, CN, and CO ⁺ (nine valence electrons) 100 · NO ⁺ , CO, and CN ⁻ (ten valence electrons) 100 NO (eleven valence electrons) 100	
Chapter 4	Polyatomic Molecules	103
4-1	Beryllium Hydride, BeH ₂	104
4-2	Localized Molecular Orbitals for BeH ₂ , BH ₃ , and CH ₄	108
4-3	Hydrogen in Bridge Bonds	114
4-4	Localized Molecular Orbital Theory for Molecules with Lone Electron Pairs—NH ₃ and H ₂ O	116
4-5	The Valence-Shell Electron-Pair Repulsion (VSEPR) Method and Molecular Geometry	121
4-6	Polar and Nonpolar Polyatomic Molecules	124
4-7	Single and Multiple Bonds in Carbon Compounds Ethylene 126 · Acetylene 129 · Benzene 130	126
4-8	Molecular Spectroscopy	135
Chapter 5	Transition-Metal Complexes	147
5-1	<i>d</i> Orbitals in Bonding	150
5-2	Ligand Field Theory for Octahedral Complexes <i>d-d</i> Transitions and light absorption 157 · Heats of hydration of hexaquo complexes 158 · π Bonding in metal complexes 159 · Factors that influence the value of Δ_o 162	152
5-3	Ligand Field Theory for Square Planar Complexes	164
5-4	Ligand Field Theory for Tetrahedral Complexes	167
5-5	Charge-Transfer Absorption Bands	169
5-6	Effect of the Nature of the Metal and the Ligand on the Stabilities of Complexes Chelation and stability 171	170
5-7	Organometallic π Complexes of Transition Metals	173
5-8	Transition-Metal Complexes and Living Systems	176
Chapter 6	Bonding in Solids	188
6-1	Types of Solids	189
6-2	Molecular Solids Van der Waals forces 194 · P ₄ and S ₈ 201 · Polar molecules and hydrogen bonds 202 · Polar molecules as solvents 206	194

6-3 Metals	209
Electronic bands in metals	210
6-4 Nonmetallic Network Solids	213
Semiconductors 216 · Silicates 218	
Appendix Physical Constants and Conversion Factors Used in Text	225
Index	227
