Preface

Introduction

2 Nomenclature and geometrical structure of coordination compounds

- 2-1 Nomenclature 6
- 2-2 Coordination numbers 9
- 2-3 The Gillespie–Nyholm approach to molecular structure 20
- 2-4 Isomerism in coordination compounds 24
- Problems 28

Preparation of coordination compound:

- 3-1 Introduction 29
- 3-2 Preparative methods 30
- Problems 40

Stability of coordination compounds

- 4-1 Introduction 41
- 4-2 Stability constants 42
- 4-3 Determination of stability constants
- 4-4 Stability correlations 47
- 4-5 Statistical and chelate effects 50
- 4-6 Solid complexes 53
- 4-7 Conclusions 54
- Problems 54

Crystal field theory of transition metal complexes

- 5-1 Introduction 55
- 5-2 Group theoretical symbols 56
- 5-3 Crystal field splittings 58
- 5-4 Weak field complexes 64
- 5-5 Strong field complexes 71
- 5-6 Intermediate field complexes 77
- 5-7 Non-octahedral complexes 82
- Problems 87

Ligand field theory of transition metal complexes

- 6-1 Introduction 88
- 6-2 Octahedral complexes 88
- 6-3 Tetrahedral complexes 95
- 6-4 Complexes of other geometries 96
- 6-5 Formal oxidation states 97
- Problems 100

Electronic spectra of transition metal complexes

- 7-1 Introduction 101
- 7-2 The electronic spectrum of vanadium (III) complexes
- 7-3 Spin-forbidden transitions 107

vi Contents

- 7-4 The effects of spin-orbit coupling 108
- 7-5 The Jahn-Teller effect 109
- 7-6 Band contours 114
- 7-7 Band intensities 116
- 7-8 Tetrahedral complexes 120
- 7-9 Complexes of other geometries 121
- 7-10 Charge-transfer spectra 121
- 7-11 Conclusions 123
- Problems 124

8 Magnetic properties of transition metal complexes

- 8-1 Introduction 125
- 8-2 Classical magnetism 126
- 8-3 The orbital contribution to a magnetic moment 129
- 8-4 Spin-orbit coupling 131
- 8-5 Low-symmetry crystal fields 133
- 8-6 Experimental results 134
- 8-7 The orbital reduction factor, k 134
- 8-8 An example 136
- 8-9 The spin-only formula 144
- 8-10 Magnetically non-dilute compounds 145
- Problems 149

9 Other methods of studying coordination compounds

- 9-1 Introduction 150
- 9-2 Infrared spectroscopy 151
- 9-3 Spectroscopic methods unique to optically active molecules 154
- 9-4 Nuclear spectroscopy 160
- 9-5 Electron spin resonance spectroscopy 164
- 9-6 Molar conductivities 168
- 9-7 Conclusion 168
- Problems 169

10 Thermodynamic and related aspects of crystal fields

- 10-1 Introduction 170
- 10-2 Ionic radii 170
- 10-3 Heats of ligation 172
- 10-4 Lattice energies 175
- 10-5 Site preference energies 175
- 10-6 Conclusions 179
- Problems 179

11 Reaction kinetics of coordination compounds

- 11-1 Introduction 180
- 11-2 Electron-transfer reactions 181
- 11-3 Mechanism of ligand substitution reactions 184
- 11-4 The substitution reactions of square planar complexes 188
- 11-5 The substitution reactions of octahedral complexes 190
- 11-6 The relative rates of substitution reactions of transition metal complexes 194
- Problems 194

Appendices

1. Some aspects of group theory 195
2. The equivalence of d_{z^2} and $d_{x^2-y^2}$ in an octahedral ligand field 199
3. The Russell–Saunders coupling scheme 200
4. Ligand group orbitals 203
5. Tanabe–Sugano diagrams 207
6. The determination of magnetic susceptibilities 210
