

Contents

1	The foundations of atomic theory	1
2	The electron in a constant potential	10
3	The hydrogen atom	15
4	Many-electron atoms and the periodic table	30
5	Basic principles of the theory of valence	39
6	The mathematical foundations of quantum mechanics	66
6.1	Postulates	66
6.2	Variation and perturbation theory	74
7	The wave functions of many-electron systems	82
7.1	The antisymmetry rule	82
7.2	The Born–Oppenheimer approximation	84
8	Symmetry	87
8.1	Introduction to symmetry groups	87
8.2	Representations of groups	94
8.3	Uses of group theory in valence problems	99
9	Angular momentum and atomic energy levels	110
9.1	Angular momentum operators	110
9.2	Atomic energy levels	113
9.3	The effect of the Pauli exclusion principle	120
9.4	Atomic spectra	124
9.5	The helium atom	126
9.6	The energies of Russell–Saunders terms	134
10	Molecular-orbital theory: its applications to the electronic structure of diatomic molecules	137
10.1	The hydrogen molecule ion	137
10.2	Molecular orbitals of homonuclear diatomic molecules	142
10.3	Correlation diagrams	150
10.4	Heteronuclear diatomic molecules	152
10.5	The non-crossing rule	159
10.6	More sophisticated calculations	161
10.7	Self-consistent field equations and molecular-orbital energies	164

11 The valence-bond theory: its application to diatomic molecules	171
11.1 The hydrogen molecule	171
11.2 Homonuclear diatomic molecules	174
11.3 Heteronuclear diatomic molecules	178
12 The bonding in polyatomic molecules	183
12.1 A comparison of MO and VB theories for diatomic molecules	183
12.2 Accurate wave functions for the hydrogen molecule	187
12.3 The role of hybridization in VB and MO theories	188
12.4 The MO theory of polyatomic molecules	194
12.5 Valence-bond theory and the method of atoms in molecules	201
12.6 Molecular integrals	209
13 Ligand-field theory	214
13.1 Simple crystal-field theory	214
13.2 The detailed crystal-field theory of weak-field complexes	220
13.3 Strong-field complexes	228
13.4 Spin-orbit coupling	232
13.5 Molecular-orbital theory	235
13.6 Tetrahedral and planar complexes	243
13.7 The Jahn-Teller effect	248
13.8 The electronic spectra of transition metal complexes	250
13.9 Conclusions	253
14 The electronic structure of electron-deficient molecules	256
14.1 The structure of diborane	256
14.2 Three-centre orbitals between boron atoms	260
14.3 Boron polyhedra	263
14.4 Other electron-deficient structures	266
14.5 A critique of electron deficiency	266
15 π-Electron theory of organic molecules	268
15.1 Introduction	268
15.2 Hückel molecular-orbital theory	270
15.3 The use of symmetry for determining Hückel orbitals	279
15.4 Cyclic conjugated polyolefins and Hückel's $4n + 2$ rule	282
15.5 Aromaticity and anti-aromaticity	286
15.6 Non-classical structures	293
15.7 Heteroatomic molecules	295
15.8 A critique of Hückel theory	299
15.9 Introduction of electron-interaction terms into π -electron theory	305
15.10 The free-electron model of π -electron molecules	309
16 The electronic theory of organic chemistry	312
16.1 Introduction	312
16.2 Resonance theory and its relationship to Hückel theory	313
16.3 The inductive effect in saturated systems I_{σ}	320
16.4 The inductive effect in unsaturated systems I_{π}	325
16.5 Hyperconjugation	328
16.6 The present status of the electronic theory of organic chemistry	330

17 Reactions and relative reactivity in organic chemistry 332

- 17.1 Introduction 332
- 17.2 Electrophilic aromatic substitution 334
- 17.3 The isolated-molecule approximation 335
- 17.4 Localization theory 339
- 17.5 Nucleophilic and radical attack 341
- 17.6 Comparison of reactivity indices 342
- 17.7 Effect of substituents on reactivity 345
- 17.8 Pericyclic reactions 347

Weak chemical bonds 357

- 18.1 Van der Waals' forces 357
- 18.2 Donor-acceptor complexes 358
- 18.3 The hydrogen bond 363
- 18.4 Sandwich compounds 366
