

CONTENTS

Preface	xi
1. Molecular study of fluids : a historical survey	1
2. Historical development and recent applications of molecular dynamics simulation	29
3. Perturbation theory, ionic fluids, and the electric double layer	47
4. A review of methods for predicting fluid phase equilibria : theory and computer simulation	73
5. A model for the calculation of thermodynamic properties of a fluid using hard-sphere perturbation theory and the zero-kelvin isotherm of the solid	107
6. Fluids at interfaces	139
7. Fluctuations of local fluxes in fluids : simulation versus langevin theory	153
8. Equations of state of nonspherical hard-body systems	173
9. Modeling of simple nonpolar molecules for condensed phase simulations	189
10. Effects of molecular anisotropy	209
11. The reference average mayer-function (RAM) perturbation theory for molecular fluids	238
12. The contribution of high frequency intermolecular motions to the structure of liquid water	281
13. Monte carlo computer simulation studies of the equilibrium properties and structure of liquid water	297
14. Fluid phase equilibria at high pressures : correlations and predictions	353
15. Thermodynamics of molecular fluids and their mixtures	365
16. Investigation of binary liquid mixtures via the study of infinitely dilute solutions	395
17. Liquid state dynamics of alkane chains	423
18. Trajectory studies of NMR relaxation in flexible molecules	445
19. Influence of flexibility on the properties of chain molecules	469
20. Simulation of polyethylene	487
index	501
