Introduction. The Nature of Physical Laws

<i>Chapter 1.</i>	The Gas Laws	5
1.1.	<i>Attractive Forces Between Ions, Molecules, and Atoms</i>	5
1.2.	<i>The Perfect Gas Law or Ideal Gas Equation</i>	9
1.3.	<i>Another Route to the Perfect Gas Law: The Kinetic Equation for Gases</i>	16
1.4.	<i>Other Relationships Derivable from the Kinetic Equation for Gases</i>	18
1.5.	<i>An Equation of State for Real (Nonideal) Gases: The van der Waals Equation</i>	20
1.6.	<i>Dalton's Law of Partial Pressures</i>	23
1.7.	<i>The Barcroft-Warburg Manometric Method as an Application of the Gas Laws</i>	24
<i>Chapter 2.</i>	The Laws of Thermodynamics and an Introduction to the Free Energy Concept	30
2.1.	<i>The First Law of Thermodynamics</i> Definitions. The statement of the First Law. Illustrations of the First Law.	31
2.2.	<i>The Enthalpy, H</i> Thermochemistry.	44
2.3.	<i>The Second Law of Thermodynamics</i> The entropy concept and a search for a new state function. Statements of the Second Law. Entropy and probability. Calculating the entropy change. The entropy change and predicting the direction of spontaneity.	51
2.4.	<i>Absolute Entropies and the Third Law of Thermodynamics</i>	60
2.5.	<i>The Free Energy</i> The free energy of formation.	62
2.6.	<i>Thermodynamic Studies on the Structure of Water</i>	68

Chapter 3. Chemical Equilibrium in Heterogeneous and Homogeneous Systems

3.1. *The Chemical Potential*

3.2. *Definitions*

The mole fraction. The escaping tendency. The ideal solution.

3.3. *Principles Governing Heterogeneous Equilibria*

The Phase Rule. The Clausius-Clapeyron Equation.

3.4. *The Colligative Properties of Solutions*

Raoult's Law. Freezing point lowering and boiling point elevation. Osmotic Pressure. Measurement of the colligative properties. The Gibbs-Donnan Effect. Dialysis.

3.5. *Biological Applications of Phase Diagrams and the Phase Rule*

3.6. *Free Energy and Chemical Equilibrium*

3.7. *The Effect of Temperature on Chemical Equilibrium*

3.8. *Living Systems and ΔG*

Transfer reactions in which the energy of ATP is conserved. Reactions involving utilization of the free energy of ATP. Tandem reactions.

Chapter 4. Solutions of Electrolytes

4.1. *General Considerations of Strong and Weak Electrolytes*

Weak electrolytes. Strong electrolytes.

4.2. *Acid-Base Equilibria: Practical Considerations and Calculations*

The titration curve. First case: an acid or a base in solution. Second case: the equivalence point in a titration. Third case: buffers. Fourth case: polyprotic acids. Fifth case: equivalence point in the titration of a polyprotic acid. Sixth case: a buffer of prescribed pH and ionic strength.

4.3. *Indicators of pH*

Theory of indicators. Sources of error in the use of indicators.

4.4. *Acid-Base Equilibria in the Dissociation of Amino Acids*

Amino acids as Brønsted acids. Titration curves. Miscellaneous uses of amino acid pK'_a values.

4.5. *Theoretical Considerations Involving Polyprotic Species*

Microscopic and macroscopic dissociation constants.

4.6. *Some Biologically Important Consequences of the Ionic Environment*

Salting-in and salting-out of polar molecules. The formation of coordination compounds.

Chapter 5. Electrochemical Cells

5.1. *Electrical and Chemical Work*

5.2. *The Galvanic Cell and Cell Conventions*

5.3. *Types of Half-cells*

5.4.	<i>Cells and Electrodes Meriting Special Consideration</i>	197
	The reference cell or standard cell. Reference electrodes. The concentration cell. Fuel cells.	
5.5.	<i>The Determination of pH</i>	203
	Normal calomel electrode and hydrogen electrode. Quinhydrone electrode and normal calomel electrode.	
5.6.	<i>Sample Calculations</i>	205
	The standard cell. The nonstandard cell. The concentration cell.	
5.7.	<i>Oxidation-Reduction in Biological Systems</i>	207
Chapter 6.	Kinetics	213
6.1.	<i>Writing the Rate Equation</i>	214
6.2.	<i>Reaction Order and Molecularity: Definitions</i>	216
6.3.	<i>Several Forms of the First-order Rate Equation</i>	217
6.4.	<i>The Second-order Rate Equation</i>	220
6.5.	<i>The Third-order Rate Equation</i>	223
6.6.	<i>The Zero-order Rate Equation</i>	224
6.7.	<i>Complex Reactions</i>	225
6.8.	<i>Kinetics of Enzyme-catalyzed Reactions</i>	228
	Rate equations. The significance of K_m and V_{max} . The Michaelis-Menten Equation and enzyme mechanisms. Enzyme inhibition.	
6.9.	<i>The Arrhenius Equation:</i> <i>The Effect of Temperature on Reaction Rate</i>	239
Chapter 7.	Systems of Large Particles: Macromolecular Solutions and Colloidal Dispersions	250
7.1.	<i>The Surface Energy</i>	251
7.2.	<i>Adsorption Isotherms</i>	252
7.3.	<i>Adsorption on Surfaces</i>	257
7.4.	<i>Types of Molecular Weights</i>	260
7.5.	<i>The Transport Properties of Macromolecular Systems</i>	262
	Electrophoresis. Diffusion. Sedimentation. Viscosity. Flow birefringence.	
7.6.	<i>The Optical Properties of Macromolecular Systems</i>	294
	Optical rotatory dispersion. Light scattering.	
7.7.	<i>Comparison of Methods for the Determination of Molecular Weight</i>	305
Chapter 8.	The Principles of Nuclear Chemistry and Some Biological Applications	312
8.1.	<i>Disintegration of Radioactive Elements: Nuclear Equations</i>	313
8.2.	<i>Kinetics of Nuclear Disintegrations</i>	317

8.3.	<i>Nuclear Fission and Reactors</i>	318
8.4.	<i>Particle Accelerators</i>	321
8.5.	<i>The Measurement of Radioactivity</i>	323
8.6.	<i>Biological Research Applications</i>	324
	Tracer studies. Isotope dilution. Nuclear activation analysis. Other applications.	
<i>Appendix A.</i>	Mathematics	333
<i>Appendix B.</i>	Symbols and Notation	372
<i>Appendix C.</i>	Fundamental Constants	374
<i>Appendix D.</i>	International Atomic Weights	375
	<i>Index</i>	376
