FOREWORD

page vii

I. THE PROPERTIES OF GASES

1

Summary of Ideal Gas Laws—Kinetic Theory of Gases—Kinetic Theory of Gases and the Gas Laws—The Kinetic Theory and Temperature—Real Gases—Van der Waal's Equation—Positive and Negative Deviations from the Ideal Gas Behaviour—Critical Phenomena of Gases

II. THE FIRST LAW OF THERMODYNAMICS

23

Historical Outlines—The Nature of the First Law—Change in Internal Energy (ΔU) of an Ideal Gas at Constant Volume—Change in ΔU at Constant Pressure—Reversible and Irreversible Processes; Maximum Work—Isothermal Expansion of an Ideal Gas—Adiabatic Expansion of Ideal Gases—The Joule Experiment—The Joule-Thompson Experiment—The Joule-Thompson Coefficient—Heat of Formation and Enthalpy—Hess's Law and Heats of Reaction—The Variation of Enthalpy Change with Temperature; Kirchhoff's Equation—Heat Capacities of a System—Derivation of Kirchhoff's Equation

III. THE SECOND LAW OF THERMODYNAMICS

54

The Efficiency of a Cyclic Process—The Carnot Cycle—Entropy Changes in Gases—The Significance of the Sign of Entropy Change of a process in a Closed System—Calculation of Entropy Change from Heat Capacities—Entropy and the Degradation of Energy in Real Processes—Entropy and the Thermodynamic Absolute Temperature Scale—Entropy and Randomness

IV. THE HELMHOLTZ AND GIBBS FREE ENERGIES

80

The Derivation of Helmholtz and Gibbs Free Energies—The Significance of the Sign of Free Energy Change (ΔG)—The Meaning of Thermodynamically Possible Process—Determination of ΔG from Thermal Data—Some Useful Relationships between the Gibbs Free Energy and other Thermodynamic Functions—The Gibbs-Helmholtz Equation.

V. THE THIRD LAW OF THERMODYNAMICS

93

CONTENTS

VI. CLAUSIUS-CLAPEYRON EQUATION	96
<i>Derivation of the Clausius-Clapeyron Equation for a Single Substance—Duhring's Rule for the Estimation of the Vapour Pressure of an Element—Solid-Solid Equilibrium—Integration of Clausius-Clapeyron Equation</i>	
VII. THERMODYNAMICS AND CHEMICAL EQUILIBRIUM	105
<i>The Law of Mass Action and Equilibrium Constants—Equilibrium Constants in Gaseous Reactions—The Relationship between K, and K_c—The Relationship between K, and K_N—The Van't Hoff Isotherm—The Gibbs Standard Free Energy Change of a Process (ΔG^0)—The Effect of Temperature on the Equilibrium Constant of a Reaction (Van't Hoff's Isochore)—The Van't Hoff Isochore and Le Chatelier Principle—Integration of Van't Hoff Isochore</i>	
VIII. THERMODYNAMICS OF SOLUTIONS	117
<i>Ideal Solutions—Partial Molal Quantities—Gibbs-Duhem Equation—Integral and Partial Molal Quantities—Graphical Determination of Partial Molal Quantities—The Vapour Pressure of Ideal Solutions, Raoult's Law—The Elevation of Boiling Point by a Non-volatile Solute—Depression of Freezing Point and Simple Application to a Liquidus Line—Chemical Potential of Ideal Solutions—Calculation of Chemical Potential in Non-Ideal Solutions—Activity and Fugacity and Chemical Potential in Non-Ideal Solutions—Raoultian and Henrian Activities—Activity Coefficients and Heat of Mixing of Regular Solutions—The Use of Gibbs-Duhem Equation for Determination of Activity</i>	
IX. THE EFFECT OF TEMPERATURE AND PRESSURE ON EQUILIBRIA IN METALLURGICAL PROCESSES	155
<i>Calculation of Equilibrium Constant from Standard Free Energy Changes—General Description of the Ellingham Diagrams—Properties of a Single Standard Free Energy Change/Temperature Line—Interpretation of Two or More Free Energy Change/Temperature Lines taken together—Derivation and use of the Oxygen Nomographic Scale in Richardson's Diagrams—Disadvantages of the $\Delta G^0/T$ Diagrams</i>	
X. APPLICATION OF THERMODYNAMICS TO SIMPLE EQUILIBRIUM PHASE DIAGRAMS	175
<i>The Derivation of the Gibbs Phase Rule—Definition of Terms—Derivation of the Phase Rule Equation—Illustration of the Gibbs Phase Rule for a One-component System—Calculation of the Liquidus Line of Bismuth-Cadmium Eutectic Binary System and Application of the Phase Rule to this Equilibrium Phase Diagram.</i>	

CONTENTS

The Use of Free Energy|Concentration Diagrams for the Calculation of a Simple Equilibrium Phase Diagram for Components Showing Complete Miscibility in the Liquid and Solid Phases—Free Energy|Concentration Diagrams for Non-Ideal Solutions—Two Components Form a Compound with a Congruent Melting Point and are Completely Immiscible—Two Components are Completely Miscible in the Liquid State but only Partially Miscible in the Solid State

XI. CHEMICAL KINETICS

196

Kinetics of Chemical Processes—The Nature of Reactants and Products—The Effect of Temperature on Reaction Rates—Simple Kinetic Theory of Chemical Reactions: Collision Theory—Energy of Activation and Free Energy Change of a Process—Determination of the Energy of Activation—The Theory of Absolute Reaction Rates Effect of Concentration on Rate of Reaction—Determination of Order of Reactions—Consecutive and Simultaneous Reactions—Catalysis in Chemical Reactions—Properties of Catalysts—Theories of Catalysis

XII. ELECTROCHEMISTRY: CONDUCTION BY ELECTROLYTES

230

Electrolysis and Faraday's Laws—Mechanism of Electrolytic Conduction—Measurement of Electrolytic Conductance—The Effect of Concentration and Temperature on Equivalent Conductance—The Independent Migration of Ions—Some Applications of Conductivity Measurements—Transport Numbers

XIII. EQUILIBRIA IN ELECTROLYTES

250

Acids, Bases, and Salts—Strength of Acids and Bases—Dissociation Constant of Water, Ionic Product of Water and pH—Solubility Products (K_s)—Common Ion Effect—Hydrolysis of Salts—Buffer Solutions—Electrochemical Cells—Galvanic Cells—Chemical and Electrical Energy—Thermodynamics of Electrochemical Cells—Concentration Cells—Reference Electrodes—Standard Cells—Potentiometric Titrations—Irreversible Electrode Potentials—Electrolysis—Mechanism of Electrolysis—Cathodic and Anodic Reactions—Decomposition Potential—Hydrogen and Oxygen Overvoltage—Electrolysis of Fused Salts

XIV METHODS FOR DETERMINING THERMODYNAMIC FUNCTIONS

300

Summary—Bibliography of Thermodynamic Values and Methods for their Determination
