Preface, vii

1 Introduction, 1

Part A: Molecular Structure and Spectroscopy

2 Molecular Electronic Structure, 11

2.1 Introduction, 11

2.2 The Born–Oppenheimer separation, 13

2.3 *Ab initio* methods for the calculation of molecular wavefunctions, 16

2.4 Semi-empirical methods, 84

3 Molecular Mechanics, 101

3.1 Introduction, 101

3.2 Potential-energy functions for molecular mechanics, 101

3.3 Energy minimization, 108

3.4 Some applications of molecular mechanics, 112

4 Molecular Energy Levels and Potential-energy Surfaces, 121

4.1 Introduction, 121

4.2 Diatomic molecules, 122

4.3 Polyatomic molecules, 141

Part B: Chemical Reactions

5 The Modeling of Complex Chemical Reactions, 157

5.1 Introduction, 157

5.2 Models for complex reaction systems, 158

5.3 Modeling of atmospheric chemistry, 177

5.4 The chemistry of interstellar clouds, 188

6 The Calculation of Rate Constants, 204

6.1 Introduction, 204

6.2 Transition-state theory, 205

6.3 Unimolecular reactions, 210

6.4 Applications, 247

7 Reaction Dynamics, 255

- 7.1 Introduction, 255
- 7.2 Reaction cross-sections, 256
- 7.3 Quasi-classical trajectory calculations, 260
- 7.4 Quantum scattering theory, 286
- 7.5 Semi-classical methods, 316

Part C: Liquids and Macromolecules

8 The Liquid State, 333

- 8.1 Introduction, 333
- 8.2 Review of some ideas in statistical mechanics, 337
- 8.3 The Monte Carlo method, 355
- 8.4 The method of molecular dynamics, 360
- 8.5 Intermolecular potentials for computer-simulation studies, 372
- 8.6 Some applications, 375

9 The Simulation of Proteins and Macromolecules, 394

- 9.1 Introduction, 394
- 9.2 The simulation of the dynamics of proteins and nucleic acids, 395
- 9.3 Simulation of polymers, 416

Index, 437
