

CONTENTS

	PAGE
Introduction	iii
1. Quality Tests	
2. Significant Pathogens in Dairy Products	13
Bacterial infections and intoxications	14
Pathogenic fungi	21
Viral and rickettsial diseases	22
3. Collection of Milk and Cream Samples	28
4. Agar Plate Method	34
5. Coliform Bacteria	53
6. Thermoduric, Thermophilic, and Psychrophilic Bacteria	68
Thermoduric bacteria	68
Thermophilic bacteria	69
Psychrophilic bacteria	70
7. Detection of Inhibitory Substances in Milk	72
8. Microbiological Methods for Concentrated Milk and Dry Milk	77
Evaporated and sterile concentrated milk	77
Condensed milk	79
Dry milk	81
9. Microbiological Methods for Butter	87
Yeast and mold counts	89
Bacteriological analyses	90
10. Microbiological Methods for Cheese and Other Cultured Products	92
Collection of samples	93
Microbiological analyses	96
11. Microbiological Methods for Ice Cream and Related Frozen Products	98
12. Direct Microscopic Method	108
13. Reduction Methods	129
Methylene blue reduction method	129
Resazurin reduction method	136

	PAGE
14. Microbiological Tests for Equipment, Water, and Air	142
Rinse solution method	142
Swab contact method	146
Tests for water supplies	147
Tests for air supplies	148
15. Sediment in Fluid Milk	150
16. Phosphatase Methods To Determine Pasteurization	156
Scharer rapid phosphatase test	161
Modified spectrophotometric phosphatase method	166
The Cornell phosphatase test	168
Dialysis phosphatase test	171
Phosphatase reactivation in HTST and UHT pasteurized milk and cream	176
Differentiation of reactivated from residual phosphatase	178
Detection of heated milk admixed with raw milk	180
17. Miscellaneous Chemical Methods	183
Fat in milk—Gerber method	183
Fat in cream—Gerber method	188
Fat in chocolate milk—Gerber method	189
Added water in milk—thermistor cryoscope	190
Thiosulfate titration method for available chlorine	193
18. Radionuclides in Milk	196
Chemical separation of radionuclides	200
19. Simplified Technics for Viable Counts of Raw Milk	217
Oval tube or bottle culture method	217
Plate loop method	219
Roll tube method	221
APPENDIX A: Culture Media and Preparation	224
Culture media	224
Culture media formulas and instructions	228
APPENDIX B: Miscellaneous Microbiological Control Methods	243
Screening for inhibitors—TTC reduction	243
Screening for inhibitors—reverse-phase disc assay	244
Microbiological screening method for retail milk containers	245
Screening methods for large equipment	245
Swabbing methods	246
Swabbing screening method	247
Rodac plate method—agar contact method	249
Screening test for air sedimentation	249
Screening test for air	250
Screening tests for psychrophilic microorganisms in water supplies	253
Cleaning glassware and microbiological testing for growth inhibition	253
Preparation of buffered distilled water and micro- biological testing for toxicity	254
Distilled water suitability	255
APPENDIX C: Chemical Auxiliary or Screening Methods	261
Fat in frozen desserts—screening test, Gerber method	261
Fat in homogenized milk—screening test, Babcock method	262
Solids in Milk, lactometric method at 39 C (102 F)	263

CONTENTS

	PAGE
Hydrolytic rancidity, screening test	267
Pesticide residues in milk screening	270
Extraction of fat	270
Cleanup	272
APPENDIX D: Screening Technics for the Detection of Ab-	
normal Milk	279
The modified Whiteside test	279
The California mastitis test	281
The catalase test	284
The Wisconsin mastitis test	287
Feulgen-DNA measurements of total milk somatic cells	292
FIGURES	
4-1 Glass bacteriological transfer pipettes	36
4-2 Dark-field Quebec colony counter	39
4-3 Lower side of pipette touches inside of container	42
4-4 Preparation of dilutions	44
12-1 Microscope slide	111
12-2 Slide with circular square-centimeter areas	111
12-3 Guide plate	112
12-4 Transfer instruments	113
12-5 Film drying box	115
12-6 Ocular disc	116
12-7 Köhler-type illumination	118
12-8 Critical illumination	118
13-1 Stainless steel round-bottom dipper	132
16-1 Milk being pipetted into cellulose bag	174
16-2 Cellulose bag being lowered into test tube	175
16-3 Preparing to read transmitted light values	177
17-1 Gerber milk-test bottle, lock stopper and key	184
19-1 Plate loop outfit showing vertical removal of loop	223
C-1 Dimensions of 102 F glass lactometer	263
D-1 Adding reagent at least $\frac{1}{4}$ inch below surface of milk	289
D-2 Mixing reagent with milk	289
D-3 Timing inversion with sweep second hand of clock	290
D-4 Estimating leucocyte count directly	291
TABLES	
4-1 Examples for computing standard plate counts per ml	50
5-1 Most probable number per 100 ml of sample and 95% confidence limits	63
5-2 MPN estimates and confidence limits on the estimates for fermenta- tion test tubes	64
12-1 Suggested microscopic factors when making direct microscopic clump counts per ml	122
16-1 Phenol standards	164
16-2 Phenol color standards	170
16-3 Proportioning solutions for standards and final development	173
16-4 Quantity of $MgCl_2$ versus butterfat content of sample	179
16-5 Micrograms phenol per ml of various dilutions of raw and boiled milk	181
18-1 Nitric acid proportions for strontium and barium precipitations	210
Number of replicate plates for each medium to be tested (un- numbered tabulation)	241
C-1 F values for Babcock fat determinations	266
C-2 M values for lactometer readings from 25.5 to 34.9	266
C-3 S values for lactometer readings from 35.0 to 37.4	267
Grading and interpretation, California mastitis test (unnumbered tabulation)	283
Cell counts with catalase activity (unnumbered tabulation)	286
