

CONTENTS

Series Editor's Preface	xvii
Acknowledgements	xviii
Authors' Preface	xix
Chapter 1 Electromagnetic radiation and the electromagnetic spectrum	1
1.1 Wave nature of electromagnetic radiation – wave characteristics and wave parameters	2
1.2 Quantum concept and particle nature of electromagnetic radiation	6
1.3 Units of wave parameters	7
1.4 Origin of electromagnetic radiation and electromagnetic spectrum : γ -rays to microwave	7
General bibliography	9
Chapter 2 Interaction of electromagnetic radiation with matter	11
2.1 Absorption of electromagnetic radiation	11
2.2 Presentation of data : a line spectrum	12
2.3 Line broadening in infrared absorption spectrometry	13
2.4 Measured spectra of diatomic molecules	15
2.5 Normal or fundamental vibrations	15
2.6 Infrared spectrum of polyatomic molecules	17
General Bibliography	18
Chapter 3 Theory of infrared spectroscopy	19
3.1 Principles of infrared spectroscopy	19
3.2 Characteristics of infrared spectroscopy	22
3.3 Molecular vibrations	23
3.4 A vibration of a diatomic molecule	23
3.5 Quantum mechanical treatment of a vibration of a diatomic molecule	27
3.6 Vibrations of polyatomic molecules	29
3.7 Quantum mechanical treatment of vibrations of polyatomic molecules	31
3.8 Anharmonicity	33
3.9 Overtones and combination modes	37
3.10 Fermi resonance	38
General reading	39

Chapter 4	Symmetry of molecules, group theory and its applications in vibrational spectroscopy	41
4.1	Symmetry of molecules : symmetry elements and symmetry operations	42
4.2	Group theory and symmetry operations as elements of a group	56
4.3	Matrix representation of the symmetry operations	59
4.4	Character of the symmetry operations	64
4.5	Classes of operations	65
4.6	Reducible and irreducible representations	70
4.7	Application to molecular vibrations	79
4.8	Examples	85
4.9	Measured vibrational spectra of molecules	94
	References	95
	General bibliography	96
Chapter 5	Group frequencies and assignments of the infrared bands	97
5.1	Group frequencies	97
5.2	Isotope shift	99
5.3	How to make band assignments in infrared spectra	100
	References	102
	General bibliography	103
Chapter 6	Instrumentation	105
6.1	History of infrared instrumentation	105
6.2	Components of an FT-IR spectrometer	107
6.3	Detector noise	112
6.4	Performance of an infrared detector	113
6.5	Other components	116
6.6	Dispersive instruments	117
6.7	Michelson interferometer	118
6.8	Advantages of interferometry	120
6.9	Apodization	121
6.10	Resolution	122
6.11	Phase correction	123
6.13	Effects of mirror misalignment	124
6.14	Fourier transformation and its use in FT-IR instrumentation	127
	References	128

Chapter 7	Sampling techniques and applications	131
7.1	Transmission spectroscopy	131
7.2	Internal and external reflection spectroscopy	136
7.3	Diffuse reflectance spectroscopy	155
7.4	Photoacoustic spectroscopy	155
7.5	TGA/FT-IR	158
7.6	LC/FT-IR	172
7.7	GC/FTIR	180
7.8	SFC/FTIR	182
7.9	Infrared microspectroscopy	188
	References	190
Chapter 8	Applications of infrared spectroscopy in basic and industrial research	195
8.1	Polymer applications	195
8.2	Applications to liquid crystals and liquid crystal polymers	211
8.3	Applications to optically active materials	214
8.4	Applications to infrared microspectroscopy	222
8.5	Applications to industrial process	235
8.6	Applications to organic thin films	236
8.7	Developments in infrared spectroscopy of biological molecules and materials	254
	References	277
Chapter 9	Modern data analytical methods for infrared spectroscopy	285
9.1	Univariate approach in infrared spectroscopy	285
9.2	Multivariate approach in infrared spectroscopy	286
9.3	Principal component analysis (PCA)	292
9.4	Multivariate calibration	294
9.5	Target projections	300
9.6	Data analysis and resolution by alternating least squares	307
9.7	Two-dimensional correlation spectroscopy	318
	Acknowledgements	329
	References	329
Appendix I.	Physical constants, conversion factors and atomic masses	333
Appendix II.	Some character tables and point groups	335
Appendix III.	Matrices	339
