Foreword. by N. S. Nametkin	IX
Preface to the English edition	XI
Introduction	XIII
1. Basic principles of gas chromatography	1
Examples of applications.	6
Analysis of complex mixtures	6
Determination of physicochemical quantities	7
Preparation techniques	7
GC equipment.	9
Sample injectors	10
Columns.	12
Detectors	12
Katharometer.	12
Flame-ionization detector.	13
Theoretical concepts of the GC separation process	13
Eddydiffusion.	20
Molecular diffusion	21
Resistance to mass transfer	21
Qualitative and quantitative analysis	22
Qualitative analysis	22
Standard compound method.	23
Method using tabulated data.	23
Method of several phases	24
Computational methods and correlation ratios	24
Physicochemical methods	25
Preliminary treatment of the sample	25
Quantitative analysis.	26
Internal normalization method	28
Absolute calibration method.	28
Internal standard method	28
References.	29
2. Gas chromatographic methods for the analysis of monomers and solvents.	33
Specific features of the GC analysis of impurities	34
Methods for improving the sensitivity of the determination of impurities	41
Increasing the size of the sample being analyzed	41
Use of high-sensitivity detectors	43
Application of non-isothermal methods	44
Concentration methods	47
Preparative elution chromatography.	47

Chromatography without a carrier gas (high-concentration GC)	47
Frontal chromatography.	48
Methods for demasking impurities against the background of the main component	51
Utilization of selective sorbents and selective detectors	51
Analytical reaction GC	52
References.	52
3. The study of polymer formation reactions.	59
Investigation of polymerization reactions	59
Study of copolymerization reactions	72
Study of polycondensation reactions	76
References.	80
4. Determination of volatile compounds in polymer systems	85
Direct analytical methods.	87
Multi-stage methods for determining volatile components	93
Determination of volatile components in polymer solutions.	93
Application of extraction methods.	100
Application of methods for separating volatile impurities from polymers	102
Specific features of the GC analysis of solvents, monomers, plasticizers and stabilizers.	103
References	108
5. Study of the kinetics and mechanisms of chemical transformations of polymers at elevated temperatures	113
Static methods for studying chemical conversions of polymers	114
Dynamic methods for studying polymer conversion processes.	116
Periodic GC analysis of volatile products	116
Automatic analysis of volatile products	121
Use of GC detectors for the continuous analysis of volatile products.	124
Impulse pyrolysis of polymers	127
Specific features of procedures for studying thermooxidative degradation	131
Application of GC in studying the degradation of polymers	140
References	140
6. Reaction gas chromatography of polymers	145
References	156
7. Pyrolysis gas chromatography	159
Equipment and experimental procedure.	160
Identification of polymers	175
Determining the composition of polymer systems (mixtures and copolymers)	179
Non-analytical applications of pyrolysis GC.	183
Conclusion.	189
References	190

8. Inverse gas chromatography	195
Identification of polymers	196
Determination of the molecular weight of oligomers	199
Investigation of the thermodynamics of interaction of volatile compounds with polymers	206
The study of phase transitions	209
Investigation of the kinetics and equilibria of chemical reactions	215
References	221
Conclusion	225
