

CONTENTS

1. Importance of metal-Ligand Bond Energies in Organometallic Chemistry: An Overview	1
2. Periodic Trends in Transition metal Bonds to Hydrogen, Carbon, and Nitrogen	18
3. Organometallic Reaction Energetics from Product Kinetic Energy Release Distributions	34
4. Methods for Determining Metal-Ligand and Metal-Metal Bond Energies Using Fourier Transform Mass Spectrometry	55
5. Gas-Phase Thermochemistry of Organometallic and Coordination Complex Ions	70
6. Ionization Energy-Bond Energy Relationships in Organometallic Chemistry	84
7. Thermodynamics and Kinetics of Transition Metal-Alkyl Homolytic Bond Dissociation Processes	100
8. Cage Pair Intermediates and Activation Parameters	113
9. Thermodynamic and Kinetic Studies of Binding Nitrogen and Hydrogen to Complexes of Chromium, Molybdenum, and Tungsten	133
10. Thermodynamic Studies of the Hydrogenation and Reductive Coupling of Carbon Monoxide by Rhodium (II) Porphyrins	148
11. Metal and Ancillary Coordination Effects on Organolanthanide Ligand Bond Enthalpies: Implications for Bonding and Reaction Patterns	159
12. Novel Extensions of the Electrostatic Covalent Approach and Calorimetric Measurements to Organometallic Systems	175
13. Metal-Ligand Bond Dissociation Energies in CpMn(CO) ₂ L and Cr(CO) ₅ (olefin) Complexes	195
14. Metal-Carbon and Metal-Hydrogen Bond Dissociation Enthalpies from Classical and Nonclassical Calorimetric Studies	205
15. Adsorbate-Induced Restructuring of Surfaces: Surface Thermodynamic Puzzle	218
16. Acid Sites on Chemically Modified Molybdenum Surfaces	239
17. Absolute Electronegativity, Hardness, and Bond Energies	251
18. Gas-Phase Chemistry of First-Row Transition Metal Ions with Nitrogen-Containing Compounds: Theoretical and Experimental Investigations	263
19. Periodic Trends in the Bond Energies of Transition Metal Complexes: Density Functional Theory	279
