

CONTENTS

Chapter One The Principles Of Quantum Mechanics	
1.1 Introduction	1
1.2 The Basic Problem	1
1.3 The Formalism of Quantum Theory	3
1.4 Degeneracy, Simultaneous Measurement, and Commutation Rules	7
1.5 The One-dimensional Simple Harmonic Oscillator	11
1.6 Representations; The Schrodinger Representation	13
1.7 The Schrodinger Equation and Its Solution	18
Chapter Two Exact and Approximate Solutions of The Schrodinger Equation	
2.1 The Schrodinger Equation for the Hydrogen Atom	23
2.2 Real and Complex Wave Functions	29
2.3 Many-Particle Systems	30
2.4 The Hartree SCF Method	31
2.5 The Orbital Approximation	35
2.6 The Variation Method	36
2.7 Matrix Representation	42
2.8 Perturbation Theory	47
2.9 The Original Pauli Principle	53
2.10 Electron Spin	53
2.11 Molecular Symmetry	54
2.12 The True Principle; Slater Determinants	55
2.13 The Hartree-Fock Method	57
2.14 Closed-Shell Molecules	64
2.15 Slater-Zener Orbitals	65
2.16 The Roothaan Method	67
2.17 Choice of Basis-set Functions; the LCAO Approximation	72
2.18 Orbital Energies and Ionization Potentials; Koopman's Theorem	74
Chapter Three Semiempirical Lcao Mo Methods	
3.1 Introduction; Physical Interpretation of the Roothaan Method	77
3.2 The Mulliken Approximations for Integrals	80
3.3 The Pople Method	82
3.4 More Detailed Analysis of the Pople Method	84
3.5 The Goeppert-Mayer-Sklar Potential	89
3.6 Charge Densities and Bond Orders	91
3.7 The Huckel (HMO) Method	92
3.8 Attempts to Improve the Huckel Method	98

3.9 Physical Significance of Bond Orders	100
3.10 Configuration Interaction	102
3.11 The Pariser-Parr and Ruedenberg Methods	105
Chapter Four Atoms And Simple Molecules	
4.1 The Orbital Picture of Atoms	109
4.2 The Vector Model and Hund's Rules	111
4.3 The Hydrogen Molecule	116
4.4 H ₂ ⁺ ; Polar and Dative Bonds	120
4.5 The System H ₂ ; Role of the Electron Pair in Bonding	122
4.6 Two-center Covalent Bonds; Electronegativity and Pauling's Rule	122
4.7 Orbital Symmetry	124
4.8 Li ₂ ; The Core Approximation	125
4.9 Other Diatomic Molecules Formed by First-row Elements; σ and π Orbitals and Hybridization	127
4.10 Methane; Promotion, Hybridization, and Localized Orbitals	135
4.11 The Paraffins; the Localized-bond Model	140
4.12 The Localized Bond Principle	143
4.13 Hybridization and Geometry	143
4.14 Double and Triple Bonds	145
4.15 The Effects of hybridization and Electronegativity on Bond Properties	147
4.16 Bond-dissociation Energies	151
Chapter Five Conjugated And Aromatic Hydrocarbons	
5.1 Introduction; the Huckel Approximation	153
5.2 Huckel Treatment of Conjugated Hydrocarbons	154
5.3 Semiempirical SCF MO Treatments of Conjugated Hydrocarbons, Using the Pople Method	156
5.4 Conjugated Hydrocarbons	168
5.5 Classical Polyenes	173
5.6 Resonance Energies; Benzenoid and Nonbenzenoid Hydrocarbons and Aromaticity	176
5.7 Huckel's Rule	177
5.8 Validity of the Bond-order-Bond-length Relation	180
5.9 Dipole Moments	181
5.10 Bond Localization in Conjugated Systems	182
5.11 Odd Conjugated Systems	183
5.12 Scope and Limitations of the Semiempirical SCF MO Treatment of Conjugated Hydrocarbons	187
Chapter Six The PMO Method	
6.1 Chemistry as an Exercise in Perturbation Theory	191
6.2 Basic Principles of the PMO Method	192
6.3 Intramolecular Perturbations	194
6.4 Alternant Hydrocarbons; the Pairing Theorem	199
6.5 Charge Densities and Bond Orders in Ahs	203
6.6 Union of Even Systems	211

6.7 Union of Even Systems	208
6.8 Cyclic Classical Polyenes	210
6.9 Nonclassical Systems	211
6.10 Union of Odd Ahs	212
6.11 Calculation of NBMO Coefficients	214
6.12 Aromaticity in Even Ahs	217
6.13 Aromaticity in Even Nonalternant Hydrocarbons	220
6.14 Odd Ahs	223
6.15 Odd Nonalternant Hydrocarbons	225
6.16 The LCMO Method; NBNO Coefficients	228
6.17 Non-Kekule Hydrocarbons	232
6.18 The Role of Classical Structures; Resonance Theory	236
6.19 The Pairing Theorem in SCF MO Theory	241
6.20 Validity of the HMO Method	244
Chapter Seven Open-Shell Systems: Correlation And Configuration Interaction	
7.1 Introduction	249
7.2 The SCF MO Treatment of Open-shell Systems	251
7.3 Application of the Pople Method to Conjugated Hydrocarbon Radicals	253
7.4 The S ₂ Problem	254
7.5 Open-shell SCF Treatment of Even Systems; Horizontal Correlation and the Alternant-orbital Method	268
7.6 Heats of Formation of Radicals	272
7.7 Ionization Potentials and Electron Affinities; Koopman's Theorem	273
7.8 PMO Treatment of Radicals	276
Chapter Eight The Chemical Properties of Conjugated Hydrocarbons	
8.1 Introduction	279
8.2 Basic Principles	279
8.3 Reaction Rates and Heats of Reaction; the Bell-Evans-Polyanyi (BEP) Principle	284
8.4 Types of Chemical Reaction	288
8.5 Isoconjugate Reactions	291
8.6 OE Reactions; Protonation of Hydrocarbons	293
8.7 OE Reactions; Aromatic Substitution	296
8.8 Selectivity Effects in Aromatic Substitution	301
8.9 OE Reactions; Miscellaneous Examples	302
8.10 EO Reactions; Acid-Base Equilibria Involving Carbonium Ions	303
8.11 EO Reactions; Solvolysis of Alkyl Halides and Esters	304
8.12 Aliphatic Substitution; Nucleophilicity and the Transition from the S _N 1 Mechanism to the S _N 2 Mechanism	306
8.13 PMO Treatment of Transition States	313
8.14 EO-Reactions; Nucleophilicity and the Transition from the S _N 1 Mechanism to the S _N 2 Mechanism	306
8.15 EE Reactions; the Diels-Alder Reaction	316

8.16 EE Reactions; the Cope Rearrangement	323
8.17 EE Reactions; thermal Ring-opening Reactions in Cyclic Olefines; Huckel and Anti-Huckel Systems	325
8.18 EE Reactions; Alternative Descriptions of Electrocyclic Reactions	331
8.19 EE Reactions; Evans' Rule and Some Additional Examples of Electrocyclic Reactions	335
8.20 EE Reactions; Concerted Cycloadditions	339
8.21 EE Reactions; Concerted Eliminations	343
8.22 OO Reactions; Electrocyclic Ring Opening and Ring Closure	345
8.23 The Three-center Bond; π -Complexes	349
8.24 Reactions Involving π -complex Intermediates; π A and π R Reactions	353
8.25 Factors Controlling the Stability of π Complexes	354
8.26 MO Calculations for π Ckplexes	361
8.27 Miscellaneous Criteria of Reactivity	362
Chapter Nine Conjugated Systems Containing Heteroatoms	
9.1 Introduction	369
9.2 Parameters for Heteroatoms in the Pople SCF MO Treatment	369
9.3 Application of the Pople Method to Compounds Containing Nitrogen or Oxygen; Electronegativity Containing Nitrogen or Oxygen; Electronegativity and a polarization	376
9.4 Charge Distributions and Dipole Moments	382
9.5 Chemical Reactivity of Heteroconjugated Molecules	385
9.6 PMO Treatment of Heteroconjugated Systems	389
9.7 Resonance Energies of Even Systems	390
9.8 Odd Alternant Radicals and Ions	392
9.9 Bond Orders and Charge Densities in Even Systems	399
9.10 Bond Orders and Charge Densities in Conjugated Molecules	406
9.11 Stereochemistry of Trivalent Nitrogen in Conjugated Molecules	406
9.12 Substituents	410
9.13 Classification of Substituents	411
9.14 Some Special Substituents; the Nitro and Carboxy Groups	420
9.15 Inductive and Field Effects; the Hammett Equation	421
9.16 Indirect Electromeric Effects	426
9.17 Heteroelectrocyclic Reactions	427
9.18 Mutual Conjugation in the Transition State	428
9.19 The Role of d AOs in π Systems	430
9.20 Choice of Parameters in SCF MO Calculations for Atoms Other than C, N, and O	436
10.1 Introduction	441
10.2 The Extended Huckel Method	442
10.3 Approximations to the Hartree-Fock Treatment	443
10.4 Semiempirical SCF MO Methods Based on the Pople Approximation	444
10.5 Choice of Parameters	448
10.6 Heats of Atomization of Hydrocarbons	458

10.7 Comparison of the Valence-shell Method and the π Approximation; Validity of the Huckel Approximation	463
10.8 Dipole Moments; Lone Pairs	463
10.9 Summary	468
10.10 Postscript (Added in Proof)	468
Index	471
