

## CONTENTS

1	Sate of the Art in Molecular Spectroscopy	1
1.1	Historical Background	1
1.2	Advances in Raman Spectroscopy	2
1.3	Advances in Infrared Spectroscopy	5
1.4	States of Vibrational Theory in Molecular Spectroscopy	7
1.5	Summary	7
2	Elementary Classical Mechanical Treatment of Molecular Vibrational	9
2.1	Background	9
2.2	The Origin Vibrational Spectra	9
2.3	The Vibrations of a One-Dimensional Diatomic Molecule	11
2.4	Vibrational Selection Rules	15
2.5	Conditions for Infrared Absorption	16
2.6	Conditions for Raman Scattering	17
2.7	Elementary Treatment of the Vibrations of Small Molecules	20
2.8	Vibrational Frequencies and Displacements for a One-Dimensional Carbon Dioxide Molecule	23
2.9	Infrared Intensities of One-Dimensional Carbon Dioxide	30
2.10	Intensities of Raman Lines for One-Dimensional Carbon Dioxide	32
2.11	Elementary Treatment Using Matrices	33
3	The Vibrational Problem in Internal Coordinates	37
3.1	Advantages of Internal Coordinates	37
3.2	Vibrational Analysis of the One-Dimensional Carbon Dioxide Molecule	39
3.3	General Matrix Solution	41
3.4	General Approach to Normal Coordinate Analysis	46
3.5	Redefining the Secular Equation in Mass-Adjusted Cartesian Coordinates	48
3.6	Construction of the B Matrix	49
3.7	Example: Two-Dimensional Carbon Dioxide Molecule	49
3.8	Potential Energy Distribution	53
4	The Application of Symmetry to Vibrational Spectroscopy	54
4.1	Symmetry Elements and Operations	54
4.2	Point Groups	57
4.3	Classes of Symmetry Operations	58
4.4	Equivalent Atoms and Subgroups	59

4.5	Classification to Point Groups	60
4.6	Introduction to Character Tables	61
4.7	Matrix Representations of Symmetry Operations	63
4.8	The Symmetry Properties of Normal Coordinates	66
4.9	The Calculation of the Number of Normal Modes Internal Coordinate Representation	70
4.10	The Problem of Redundant Coordinates	74
4.11	The Problem of Redundant Coordinates	76
4.12	Selection Rules	77
4.13	Example: Determination of the Number of Active Modes of the Molecule AB <sub>4</sub>	79
4.14	Symmetry Considerations and Infrared Dichroism	80
4.15	Symmetry Considerations and Raman Polarization	82
5	The Vibrational Problem in Symmetry Coordinates	89
5.1	The Construction of Internal Symmetry Coordinates	92
5.2	Symmetry Coordinates for Degenerate Species	96
5.3	The Construction of External Symmetry Coordinates	97
6	The Molecular Force Field	100
6.1	The General Quadratic Potential Function	102
6.2	The Isotope Effect	104
6.3	Relationships Between the Vibrational Frequencies of Isotopes	106
6.4	Additional Sources of Experimental Data for the Determination of Force Constants	107
6.5	Simplified Force Fields	108
6.6	Modified Simple Force Fields	110
6.7	Local Symmetry Force Constants and Force Constant Transferability	112
6.8	Coordinate Redundancies and Indeterminate Force Constants	113
6.9	Anharmonicity; Combinations, Overtones, and Fermi Resonance	115
7	Solving the Vibrational Problem Using Computer Methods	117
7.1	Calculation of Force Constants	119
7.2	Calculation of Eigenvectors	122
7.3	The Potential Energy Distribution	124
7.4	Computer Programs for Solving the Vibrational Problem	126
8	Vibrational Analysis of Benzene	134
8.1	Symmetry Analysis	135
8.2	The Vibrational Spectrum of Benzene and Its <sup>13</sup> C Isotopes	139
8.3	Assignment of Observed Frequencies	150
8.4	Coordinate Definitions	157
8.5	A Force Field for Benzene	161

9	Infrared and Raman Intensities	167
9.1	Quantum Mechanical Description of Infrared Absorption and Raman Scattering	168
9.2	The Application of Bond Charge Parameters to the Calculation of Infrared Intensities	174
9.3	Example: Calculation of the Infrared Intensities of Sulfur Dioxide	181
9.4	The Application of Electro-Optical Parameters to the Calculation of Infrared Intensities	186
9.5	The Application of Electro-Optical Theory to the Calculation of Raman Intensities	187
9.6	Infrared and Raman Electro-Optical Parameters for the Alkanes	190
10	The Lattice Dynamics of Chain Molecules	196
10.1	The Infinite Monatomic Chain	196
10.2	Vibrations of an Infinite Diatomic Chain	199
10.3	Lattice Vibrations in Three Dimensions: Longitudinal and Transverse Waves	203
10.4	Vibrations of a Finite Lattice	206
10.5	The Distribution of Lattice Frequencies	211
10.6	Phonons; The Quantization of Lattice Vibrations	215
10.7	The Coupled Oscillator Model	215
10.8	Progression Band Series and the Observed Infrared Intensity Distribution	219
11	Symmetry Analysis of Polymer Chains and Crystals	227
11.1	Screw Axes and Glide Planes	227
11.2	Isomorphic and Cyclic Groups	228
11.3	The Irreducible Representations of a Lattice Translation Group	229
11.4	Classification of the Normal Modes and Selection Rules of the Lattice Translation Group	232
11.5	Factor Groups, Space Groups, and Line Groups	233
11.6	Normal Modes of a General Helical Chain	238
11.7	A Comparison of Line Group and Space Group Analysis	247
12	Normal Coordinate of Isolated Polymer Chains	253
12.1	The Derivation of the Secular Equation Describing an Infinite, Ordered Polymer Chain	254
12.2	Example: The One-Dimensional Diatomic Chain	261
12.3	Force Fields for Polymer Molecules	263
13	The Normal Vibrational Analysis of Polyethylene	267
13.1	Preliminary Analysis of the Vibrational Spectra of n-Paraffins	268
13.2	Intrachain Force Field for Paraffins	274
13.3	Details of the Analysis of Polyethylene	285
13.4	Dispersion Curves and Two-Phonon Effects	296
13.5	The Tetrahedral Approximation in Normal Coordinate Calculations of High Polymers	299
13.6	The Calculation of the Infrared and Raman Intensities of Polyethylene	300

14	Vibrational Analysis of Polymer Crystals	311
14.1	The Lattice Dynamic of Crystalline Polymers	314
14.2	Interchain Interactions in Polyethylene	316
14.3	Dispersion Curves in Polyethylene	324
14.4	Transition Dipole Coupling in Polypeptides	331
14.5	The Longitudinal Acoustic Mode	336
15	The Influence of Defects and Disorder on the Vibrational Spectra of Polymers	346
15.1	The Nature of Defects in Polymers	346
15.2	Preliminary Analysis of the Problem	349
15.3	The Effect of Finite Chain Length	351
15.4	Localized Conformationally Sensitive Modes	355
15.5	Numerical Analysis of Imperfect Chains	367
16	Selected Examples of the Application of Normal Coordinate Analysis to Polymers	377
16.1	Polyolefins	377
16.2	Haloethylene Polymers	397
16.3	Polydienes and Polyalkenylenes	43
16.4	Polymers Containing Aromatic Rings	495
16.5	Polyamides, Polypeptides, and Proteins	510
	Author Index	523
	Subject Index	527
