

## CONTENTS

1. Introduction	3
2. Advantages of using Polymer-Supported Reactants	3
3. Differences Between Reactions of Polymer-Supported Species and their Low-Molecular Weight Analysis	4
3.1 Access	4
3.2 Microenvironmental Effects	6
3.3 Ease of Intrapolymeric Reactions	6
3.4 Steric Effects	7
4. Preparation of Polymer-Supported Reactive Species	8
5. Reactions using Polymer-Supported Substrates	9
5.1 Solid Phase Peptide Synthesis and Solid Phase Oligonucleotide Synthesis	10
5.2 Other Examples of Reactions Involving Polymer-Supported Substrates	11
6. Reactions using Polymer-Supported Reagents	14
6.1 Polymer-Supported Reagents where the Active Groups are Ionically Bound	14
6.2 Polymer-Supported Reagents where the Active Groups are Covalently Bound	16
7. Reactions using Polymer-Supported Catalysts	18
7.1 Polymer-Supported Acids	18
7.2 Polymer-Supported Bases	21
7.3 Polymer-Supported Transition Metal Complexes and Related Catalysts other than Oxidation Catalysts	22
7.4 Polymer-Supported Oxidation Catalysts	25
7.5 Polymer-Supported Phase Transfer Catalysis	25
7.6 Other Polymer-Supported Catalysts	27
8. Conclusions and Future Developments	27
Abbreviations	27
Additional References	27
References from the Rapra Abstracts Database	31
Subject Index	103
