

CONTENTS

Optical Studies of the morphology of Polymer Films	1
Light Scattering by Oriented Native Cellulose Systems	25
Superstructure in Films of Bio and Biorelated Polymers as Noted by Small Angle Light Scattering	39
Rodlike Superstructures in and Mechanical Properties of Biaxially Oriented Polyethylene Terephthalate Film	67
Optical Anisotropy of the Statistical Segment in Block Copolymers	81
The Morphology of Ionomers	93
Study of Molecular Orientation in Polymers by Fluorescence Polarization	97
Transmission Multiple Beam Interferometry of Polymer Films	113
Infrared Studies of Chain Folding in Uniaxially Oriented Polyhexamethylene Adipamide	133
Mechanisms for Regularization of Chain Folds During Annealing of Polyhexamethylene Adipamide	151
Orientation Effects in Biaxially Stretched Polypropylene Film	169
Quantitative Structural Characterization of the Mechanical Properties of Poly (ethylene terephthalate)	191
Orientation and Crystal Transformation Associated with Deformation and Relaxation Processes in Polybutene-1	235
Microfibrillar Structure, Radical Formation, and Fracture of Highly Drawn Crystalline Polymers	253
A Mechanism of Energy-Driven Elasticity in Crystalline Polymers	267
Morphological Changes in Nylon 6 and Effect on Mechanical Properties IV. Stress-Strain Cycles	283
Transport Processes in Polymers	297
Gas, Vapor, and Water Transport in Polymer Films	321
Index	339
