

## CONTENTS

Preface	v
<b>A. Introduction</b>	<b>1</b>
I. Phenomenological Discussion	1
1. The Geometry of Stress	1
Transformation of Coordinates	4
2. The Geometry of Small Strains	8
3. Theory of Elasticity. Relationship between Stress and Strain in an Ideal Elastic Material.	10
A. Homogeneous Stress	10
The 21 Independent Elastic Constants	12
Alternative Methods of Representation for Elastic Properties of Isotropic Bodies	14
Problems Involving Simple Geometry	16
B. Nonhomogeneous Stresses	16
The Special Case When $\mu \ll \lambda$	19
C. Large Deformations	20
4. The Flow of Newtonian Liquids	23
A. Homogeneous Shear Stress	23
B. Nonhomogeneous Stresses	25
Flow of a Newtonian Liquid through a Capillary Tube	29
Flow of a Newtonian Liquid between Concentric Cylinders Undergoing Relative Rotation	31
5. Non-Newtonian Fluids and Plasticity	32
A. Homogeneous Shear Stress	32
The Question of the Yield Point	34
B. Behavior of a Non-Newtonian Liquid Subjected to Nonuniform Stresses	35
Flow of a Non-Newtonian Liquid through a Capillary Tube	36
Rotating Cylinder Viscometer	38
C. The Determination of Flow Curves	39
D. Extension of the Hydrodynamic Concepts Embodied in the Differential Equations of Viscous Flow	43
Appendix: Nonlinearity in Stress-Strain Relationships	44
6. Thixotropy: Flow Accompanied by Structure Changes	45
7. Coulomb Friction	52

8. Combinations of Elasticity and Flow, and Inertial Effects . . . . .	53
A. Maxwellian Relaxation . . . . .	54
B. Retarded Elastic Response . . . . .	57
C. Inertial Elasticity and Damped Inertial Elasticity . . . . .	59
II. Simple Molecular Mechanisms Involved in Elasticity and Flow . . . . .	62
1. The Mechanism of Elastic Displacement in Crystalline Solids . . . . .	62
A. Change of Elastic Constants with Temperature . . . . .	65
B. Types of Forces . . . . .	66
2. Liquid Flow—a Mechanism of Response to Stress . . . . .	67
A. The Structure of Simple Liquids . . . . .	68
B. Diffusion . . . . .	70
C. Viscous Flow . . . . .	71
The Question of Momentum Transfer; Relation of Gas	
Viscosity to Liquid Viscosity . . . . .	74
D. The Softening Point and Apparent Second Order Transition	
Point in Amorphous Materials . . . . .	75
The Softening Point . . . . .	77
Volume Changes . . . . .	80
The Viscosity of Liquid and Glass, Detailed Theory . . . . .	83
Force Fields and Stress Fields . . . . .	86
Bibliography . . . . .	90
B. The Plastoelastic Behavior of Amorphous Linear High Polymers . . . . .	93
I. Introduction . . . . .	93
II. Structure and Diffusion of Linear Amorphous Polymers . . . . .	94
1. Configurations . . . . .	94
2. Equilibrium Distribution among Configurations . . . . .	98
3. Diffusion . . . . .	101
III. Effect of Shear Stress—Qualitative Introductory Treatment . . . . .	103
1. Introduction . . . . .	103
2. Analysis of Four-Parameter Model . . . . .	107
A. Significance of Elements; Magnitude and Temperature De-	
pendence of Parameters . . . . .	107
The Modulus $G_1$ . . . . .	107
The Modulus $G_2$ . . . . .	108
A Note on the "Gaslike" Nature of Rubber Elasticity . . . . .	112
Magnitude and Temperature Dependence of $\eta_2$ and $\eta_3$ . . . . .	113
B. Range of Behaviors Described by Model A . . . . .	116
The Apparent Second Order Transition and Softening Point	
of Amorphous Polymers . . . . .	120
C. Model B: an Equivalent of Model A . . . . .	125
IV. Effect of Shear Stress—More Refined and Quantitative Treatment . . . . .	127
1. Phenomenological Necessity for Distribution of Retardation Times . . . . .	127
A. Complex Phenomena Resulting from a Distribution of Retar-	
dation Times . . . . .	130
B. The Fundamental Partial Differential Equation . . . . .	132
C. An Equivalent Representation for Model C . . . . .	134

2. Molecular Theory of the Viscoelastic Spectrum of an Amorphous Linear Polymer . . . . .	134
A. Different Kinds of "Segments" . . . . .	143
B. Effect of Molecular Weight on Viscoelastic Spectrum . . . . .	145
C. Effect of Polydispersity upon the Viscoelastic Spectrum . . . . .	148
D. Effect of Chemical Constitution . . . . .	152
Two-Phase Theories of Polymer Structure . . . . .	164
The Concept of "Internal Stress" . . . . .	165
3. The Empirical Four-Parameter Model . . . . .	166
More Detailed Empirical Models . . . . .	171
4. Interdependence and Nonlinearity of Plastoelastic Elements . . . . .	172
V. Shear Stress: The Dynamics of Viscoelastic Behavior . . . . .	176
1. Case (1)—Constant Stress . . . . .	178
2. Case (2)—Constant Deformation . . . . .	181
3. Case (3)—Constant Rate of Deformation . . . . .	183
4. Case (4)—Response to Stresses Varying Sinusoidally with Time . . . . .	189
5. Analogy with Electrical Networks . . . . .	193
General Use of Impedance Function . . . . .	197
6. The Principle of Superposition . . . . .	198
7. Hysteresis and Heat Loss in Cyclic Elastic Deformations . . . . .	200
A. Mechanical Nonequilibrium . . . . .	201
B. Thermal Nonequilibrium . . . . .	202
C. Phase Nonequilibrium . . . . .	203
VI. Nonhomogeneous and Combined Stresses . . . . .	204
1. Introduction . . . . .	204
2. Extension to Viscoelastic Materials . . . . .	207
3. Case in Which $f(\sigma, t)$ Can Be Factored . . . . .	210
4. General Case . . . . .	211
5. "Accessible" and "Inaccessible" States of Strain . . . . .	213
6. Special Cases . . . . .	215
7. Large Strains . . . . .	218
VII. Optical Effects in Strained Amorphous Polymers—Photoelasticity . . . . .	220
Bibliography . . . . .	228
C. Three-Dimensional Cross-Linked Polymers . . . . .	234
I. Introduction . . . . .	234
II. Mechanical Behavior of Idealized Network Types . . . . .	236
1. Loose Regular Networks Containing Material of Low Molecular Weight . . . . .	236
A. Equilibrium Behavior . . . . .	236
B. The Tetrahedral Model for the Network Structure of Rubber . . . . .	243
C. Theory of Guth and James . . . . .	246
D. Network Defects. Influence of Molecular Weight of Original Linear Polymer on Elastic Properties of a Network . . . . .	257
Network Entanglements . . . . .	257
Intramolecular Cross Linkages . . . . .	259
Terminal Chains: The Effect of Initial Molecular Weight . . . . .	259
E. Nonequilibrium Behavior . . . . .	261

2. Loose Regular Networks Containing Linear Polymer Molecules . . .	264
3. Loose Irregular Networks . . . . .	266
4. Tight Networks . . . . .	267
III. The Formation of Three-Dimensional Polymers . . . . .	268
1. Polycondensation Reactions . . . . .	268
A. Solution of the Recurrence Relationship . . . . .	277
B. Distribution of Species with Respect to Complexity ( $z$ ) . . . .	278
C. The Sol-Gel Ratio . . . . .	279
D. Number Average and Weight Average Complexities . . . . .	281
E. Distribution of Species with Respect to Size . . . . .	282
2. Cross Linking of a Linear Polymer. . . . .	284
A. Special Case: Monodisperse Polymer . . . . .	284
The Sol-Gel Ratio . . . . .	286
Number Average and Weight Average Molecular Weights . .	287
B. General Case: Arbitrary Initial Distribution Curve . . . . .	287
3. Polymerization Reactions Involving Divinyl Compounds . . . . .	292
A. Copolymerization of Vinyl Compounds . . . . .	294
Nonmathematical Predictions Concerning Copolymerization	296
B. Definition of Symmetry and Independence . . . . .	298
C. Polymerization of a Symmetrical Divinyl Compound . . . . .	299
D. Polymerization of an Unsymmetrical Divinyl Compound . . .	300
E. Copolymerization of a Vinyl Monomer with a Symmetrical	
Divinyl Monomer . . . . .	302
F. Copolymerization of a Vinyl Monomer with an Unsymmetrical	
Divinyl Monomer . . . . .	304
IV. Structures and Mechanical Properties of Actual Three-Dimensional	
Polymers . . . . .	304
1. Vulcanized Rubber . . . . .	304
Nonequilibrium Behavior . . . . .	312
2. Phenol-Formaldehyde and Related Resins . . . . .	317
3. Wool . . . . .	321
V. Chemical Change Accompanying Viscoelastic Response . . . . .	321
1. Additional Cross Linking during Deformation . . . . .	322
2. Rupture of Cross Links during Deformation . . . . .	322
3. Breaking and Re-forming of Cross Links during Deformation . .	323
A. Continued Cure of Phenolic Resins during Creep . . . . .	325
B. Stress Relaxation in Vulcanized Rubbers . . . . .	326
4. Dynamic Interchange of van der Waals' Linkages . . . . .	336
Bibliography . . . . .	337
D. Crystallization of High Polymers . . . . .	340
I. Structure . . . . .	342
II. Thermodynamics of High Polymer Crystallization . . . . .	345
Equilibrium Considerations . . . . .	346
III. Kinetics of High Polymer Crystallization . . . . .	351
IV. Effect of Specific Molecular Structure Factors on the Crystallization of	
High Polymers . . . . .	356
1. Effect of Molecular Weight and Cross Linking on Crvstallization .	359

2. Effect of Low Molecular Weight Materials on High Polymer Crystallization . . . . .	360
V. Effect of Crystallinity and the Crystallization Process on the Mechanical Properties of High Polymers . . . . .	362
1. Mechanical Properties of the Crystallites . . . . .	362
2. Mechanical Properties of a Polycrystalline Polymer, without Phase Change . . . . .	363
3. Mechanical Properties of a Polycrystalline Polymer, with Phase Change . . . . .	365
A. Crystallization during Elastic Deformation . . . . .	365
Mack Elasticity . . . . .	370
B. Effect of Crystallization on Flow in Rubber . . . . .	373
C. Crystallization of Polyvinylidene Chloride . . . . .	374
D. Effect of Crystallization on the Elastic Behavior of Nylon . . . . .	376
E. Other Examples . . . . .	378
The Creep and Recovery Behavior of Nylon . . . . .	402
VI. Mechanical Behavior of Wool . . . . .	414
Bibliography . . . . .	424
E. Plasticization and Solution: Systems Containing High Polymers and Materials of Low Molecular Weight . . . . .	427
I. Introduction . . . . .	427
II. Arrangement of Molecules in Amorphous Mixtures . . . . .	427
Localized and Directed Forces . . . . .	428
III. Effect of Low Molecular Materials on Viscoelastic Properties of High Polymers in Concentrated Systems . . . . .	431
The Random Mixture . . . . .	431
The Typical Plasticized Polar Polymer . . . . .	433
Effect of Molecular Structure of the Plasticizer . . . . .	450
IV. Dilute Polymer Solutions . . . . .	454
1. The Staudinger Equations . . . . .	456
2. Dependence of Viscosity on Concentration . . . . .	459
3. Dependence of Viscosity on Molecular Weight . . . . .	462
4. Dependence of Viscosity on Rate of Shear . . . . .	467
5. Effect of Temperature and Solvent Type on Intrinsic Viscosity of High Polymer Solutions . . . . .	468
Bibliography . . . . .	472
F. Ultimate Strength and Related Properties . . . . .	476
I. Introduction . . . . .	476
1. A Mathematical Difficulty . . . . .	476
2. A Structural Difficulty . . . . .	476
3. An Experimental Difficulty . . . . .	477
II. Geometric Considerations . . . . .	478
III. Time Effects . . . . .	481
1. Breaking Time as a Function of Stress . . . . .	481
A. Combination of Geometric and Time Complexity . . . . .	484

B. Response to Different Stress Sequences (Hypothetical) . . . . .	485
C. Ultimate Strength from the Stress-Strain Curve . . . . .	488
2. Impact Strength . . . . .	491
● IV. Correlation between Structure and Tensile Strength . . . . .	493
1. Dependence on Molecular Weight . . . . .	493
2. Influence of Molecular Weight Distribution . . . . .	495
3. Influence of Crystallization and Orientation on Tensile Strength . . . . .	500
4. Effect of Environmental Conditions . . . . .	515
Bibliography . . . . .	525
Appendix I. Tensor Representation of Stress and Strain . . . . .	534
Appendix II. Various Mathematical Methods of Specifying Viscoelastic Properties . . . . .	537
Appendix III. Tensor Treatment of Nonhomogeneous Stresses in Viscoelastic Media . . . . .	557
Appendix IV. Experimental Methods in the Scientific Mechanical Testing of High Polymers . . . . .	565
Subject Index . . . . .	571
