

CONTENTS

1 X-ray scattering and average short-range structures of liquids	1
2 New developments in neutron scattering for the study of molecular systems: structure and diffusive motions	17
3 Infrared and Raman bandshapes and molecular motions	49
4 Infrared investigation of orientational dynamics of simple polyatomic molecules in solution	71
5 Light scattering	81
6 Wave-vector-dependent light scattering as a tool for the study of vibrational relaxation in liquids	103
7 Picosecond laser techniques for the determination of vibrational time constants of polyatomic molecules	117
8 Investigation of molecular motion by spin relaxation	131
9 Nuclear spin relaxation	143
10 Molecular aspects of dielectric absorption	167
11 Dielectric behaviour of polar fluids at high pressures and temperatures	181
12 Extension of dielectric absorption studies towards the critical region of organic liquids	195
13 Dielectric and spectroscopic studies of 1,4-dioxan	205
14 Computer simulation of molecular liquids	209
15 Thermodynamic properties of organic liquids	245
16 Solvent scales and chemical reactivity	269
17 Acetonitrile-the structure of the liquid and solid phases and the nature of the liquid-solid phase transition	293
18 Description of the molecular environment by an atom-pair approximation	309
19 Molecular interactions in organic liquids	327
20 Molecular rotation in liquids	337
Index	347
