

CONTENTS

Part I. Methods	1
1. Thermogravimetry and Differential Thermal Analysis	1
2. Heat Changes and Their Measurement in DTA	2
3. Calibration and Exactness of Measurement	13
4. Quantitative Determinations by DTA	18
5. Methods Combined with DTA	21
Part II. Application of Differential Thermal Analysis to Mineralogy: Identification and Semi-Quantitative Determination of Minerals	24
1. Elements and Chalcogenides	24
2. Halogenides and Sulfates	31
3. Oxides and Hydroxides	36
4. Carbonates and Nitrates	41
5. Borates, Phosphates, and Arsenates	57
6. Ortho-, Ring-, and Chain Silicates	63
7. Sheet Silicates	64
8. Zeolites	88
9. Allophane, Opal, and Organic Matter of Soils and Sediments	91
10. Development of Identification Diagrams	93
Part III. Special Application of Differential Thermal Analysis in Mineralogy: Statements about Chemical Composition, Degree of Disorder, and Genesis of Minerals	107
1. Influence of the Chemical Composition on the Decomposition Temperatures of Carbonates and Hydroxides	107
2. Influence of the Chemical Composition on the Temperatures of Structural Transformations	115
3. Influence of the Chemical Composition on the Curie-Temperatures of Magentities	118
4. Contribution to the Classification of Chlorites	122
5. Smectites and Vermiculites: The Distinction between Di- and Tri-Octahedral Minerals and Grain Size Determination	128
6. Determination of the Degree of Disorder in Kaolinites	130
7. The Interdependence of Degree of Disorder, High-Low Inversion, and Temperature of Formation Of Low-Temperature Cristoblites	133
8. The Determination of Inversion Temperatures of Quartz Crystals as a Petrologic Tool	139
9. The High-Low Inversion Behaviour of Mecrocrystalline Quartz Crystals	146
