

## CONTENTS

	Page
<b>1. Lightning Location and Warning Systems</b>	
1. Introduction	497
2. Phenomenology of thunderstorms and lightning	498
2.1 Thunderstorms	498
2.2 Lightning	499
2.3 Fields and field changes	501
3. Climatological factors	503
4. Forecasting	505
5. Lightning warning techniques	507
5.1 Introduction	507
5.2 Weather radar	507
5.3 Spherics (atmospherics)	508
5.4 Field-changes	510
5.5 Fields	511
5.6 Combinations of techniques	513
6. Effectiveness of warning procedures	514
7. Conclusions	516
Acknowledgements	517
References	518
2. Lightning Injuries and Death	
1. Historical introduction	521
2. Conduction of electricity through the body	523
3. Some effects of electric shock	525
3.1 General remarks	525
3.2 Ventricular fibrillation	525
3.3 Respiratory arrest	527
4. Electrical effects of a lightning strike to a person	530
4.1 Types of risk	530
4.2 Direct strike	530
4.3 Contact voltage	531
4.4 Side flash	534
4.5 Step voltage	536
5. Complications of lightning injury	537
5.1 Burns	537
5.2 Other complications	538
6. Resuscitation	539
7. Concluding remarks	540
References	540
3. The Lightning Conductor	
1. The post-Franklin period	545
1.1 General survey	545
1.2 The protective zone	546
2. The attractive effect	548
2.1 Visual observations	548
2.2 The electric field under a leader channel	550
2.3 The long electric spark	553
3. The striking distance	555
3.1 Physical solutions	555
3.2 Analytical expressions	559
3.3 Effect of structure height	561
3.4 Model testing	562
3.5 Critical review	563
4. Lightning-conductor systems	564
4.1 Installation	564

4.2 Alternative protective methods	566
4.3 Prevention of lightning strikes	567
4.4 Radioactive lightning conductors	569
5. Concluding remarks	572
Acknowledgements	572
References	573
4. Lightning Earths	
1. Earthing in general	577
1.1 Principle of earthing	577
1.2 Measurement of earthing resistances	579
1.3 Resistivity	585
2. Special considerations	589
2.1 Surge performance	589
2.2 Soil breakdown	591
3. Reliability considerations	592
3.1 Electrode thickness	592
3.2 Electrode material	592
3.3 Cathodic protection	594
4. Step voltage	595
5. Concluding remarks	596
References	596
5. Protection of Structures	
1. Introduction	599
2. Effects of lightning current	600
2.1 Potential drop along conductors	600
2.2 Potential drop in, and about, earth electrodes	601
2.3 Induced voltages	602
2.4 Potential differences between adjacent conductors	605
3. External protection	605
3.1 General	605
3.2 Air terminations	606
3.3 Down conductors	608
3.4 Earth terminations	608
4. Internal protection	610
4.1 Equalization of potentials	610
4.2 Metal components on and in structures	611
4.3 Electrical installations	613
5. Materials	616
5.1 Conductors	616
5.2 Joints	618
6. Examples of structure protection	618
6.1 General	618
6.2 Air terminations	619
6.3 Buildings of usual height	620
6.4 Large buildings and halls	622
6.5 High-rise buildings	622
6.6 Towers	624
6.7 Buildings shielded by high-rise structures	626
6.8 Danger structures	627
6.9 Playing fields	629
7. Final observations	630
References	632
6. Protection of Underground Blasting Operations	
1. Introduction	633
2. The electric detonator	633
3. Accidental explosions in tunnel constructions before 1960	638
4. Effects of lightning flashes on electric detonators in the tunnel face	639
4.1 Lightning flash to mountain above tunnel	639
4.2 Lightning flash to entrance of tunnel	640

5. Detonator stress due to lightning flash above tunnel	641
5.1 Depth of current penetration	641
5.2 Electrolytic model tests	642
5.3 Electric resistance between point of lightning strike and detonators	644
5.4 Stray currents	647
5.5 Transmission of energy from lightning flash to detonators	648
5.6 Electric energy in breakdown spark in a detonator	650
6. Detonator stress due to lightning flash to entrance of tunnel	651
7. Lightning-proof detonators	653
7.1 Detonator characteristics	653
7.2 Operational rules	655
8. Assessment of performance of lightning-proof denonators	656
8.1 Lightning flash to mountain above a tunnel	656
8.2 Lightning flash to entrance of tunnel	656
8.3 Experiences with electric denonators since 1960	657
References	657
7. Protection of Aircraft	
1. Introduction	659
2. Flight observations	661
2.1 Flight lightning research	661
2.2 Flight statistics	665
3. Lightning triggering in relation to aircraft	671
4. Lightning characteristics in relation to aircraft protection	678
4.1 Laboratory reproduction of lightning environment	678
4.2 Labotatory attachment—point studies	682
5. Lightning protection of aircraft	686
5.1 Protection criteria	686
5.2 Fuel systems	686
5.3 Structures	687
5.4 Electrical and avionics circuitry	689
5.5 Radio-interference suppression	691
6. Helicopters	692
7. Space vehicles	692
8. Summary	693
References	693
8. Protection of Transmission Lines	
1. Introduction	697
2. Modes of lightning flashover	698
3. Protection against shielding failure	699
3.1 General	699
3.2 Analytical model	700
3.3 Simplified example of the design of an effective shielding system	705
3.4 Experimental and operating deviations for shielding failures	706
4. Protection against back flashover	710
4.1 General	710
4.2 Analytical expressions for reference model	713
4.3 Electrical deviations from the reference model	721
4.4 Exposure parameters for back flashover	725
4.5 Applications of the adjusted reference model	729
5. Approaches to estimation of lightning performance of lines	733
5.1 Lightning outage estimation methods	733
5.2 The “A.I.E.E. method”	734
5.3 A modernized version of the A.I.E.E. method	734
5.4 Method Carlo methods	734
5.5 Monte Carlo methods	734
5.6 Base case curves with correction factors	734
6. Lightning performance of existing lines	735
6.1 Statistical data	736
6.2 Estimated versus actual performance	736
7. Suggestions for further research	738

7.1 The ground-flash density	740
7.2 Exposure parameters related to transmission lines	740
7.3 Non-linear grounding systems	742
7.4 Critical flashover voltages for non-standard wave-shapes	742
References	742
9. Protection of Distribution System	
1. Introduction	747
2. Theoretical evaluation of induced voltages	747
2.1 The inducing field	747
2.2 The induced scalar potential	748
2.3 The induced voltage	753
2.4 The induced voltage on a short line	755
2.5 Review of published information	756
3. Voltages induced in power lines by a vertical stroke	758
3.1 Calculation of inducing field	758
3.2 Influence of front time of lightning current	761
3.3 Lightning fault frequency	761
3.4 Comparison with measurements and operating experiences	764
4. Protection of high-voltage distribution systems	767
4.1 Methods to improve lightning performance	767
4.2 Spark gaps	769
4.3 Protection of distribution stations	739
4.4 Protection of low-voltage systems	770
References	770
10. Insulation Coordination	
1. Introduction	773
2. Lightning overvoltages	773
3. Protective measures	775
3.1 Protection of overhead lines	758
3.2 Protection of substations	778
4. Insulation levels	784
4.1 Withstand voltages	784
4.2 Test procedures	785
4.3 Clearances	787
5. Future trends	788
References	789
11. Protection of Telecommunication Systems	
1. Introduction	793
2. Lightning overvoltages and currents	794
2.1 In overhead lines	794
2.2 In cables	801
3. Lightning protection	806
3.1 Overhead lines and aerial cables	806
3.2 Underground cables	807
4. Protective devices and measures	813
4.1 General	813
4.2 Evaluation of voltage—limiting devices	814
4.3 Gap protectors	815
4.4 Varistors, semi-conductor devices and coils	817
5. Recommendations for protection at line terminals	818
5.1 General	818
5.2 Local telephone networks	819
5.3 Line-transmission equipment	820
5.4 Equipment employing semi-conductor components	821
6. Protection of radio towers and equipment	822
7. Earthing arrangements	825
8. Interference on landline systems	827
9. Conclusions	827
References	828
