

## CONTENT

	<b>Page</b>
<b>1. The Scope of Biochemistry</b>	<b>1</b>
<b>Part One The Major Constituents of Cells</b>	<b>3</b>
<b>2. The Major Chemical Constituents of Cells</b>	<b>13</b>
General chemical Composition	13
Water	14
Acids and bases	18
<b>3. Proteins I</b>	<b>23</b>
Functional diversity of proteins	23
General structural design	24
Amino acids	30
Peptides	38
<b>4. Proteins II</b>	<b>42</b>
General considerations of protein structure	42
Molecular weight	43
Shape of protein molecules	50
Amphoteric properties	50
Solubility	51
Spectral analysis of proteins	53
Denaturation of proteins	56
<b>5. Proteins III</b>	<b>58</b>
Primary structure	58
Three-dimensional structure	69
<b>6. The Lipids: Biological Amphiphiles</b>	<b>83</b>
General biological roles	83
Classification	83
Monosaccharides	84
Biologically important monosaccharides	92
Oligo- and polysaccharides glycoproteins	96
<b>7. The Lipids: Biological Amphiphiles</b>	<b>107</b>
General properties	107
Classification	107
The fatty acids	108
Lipids containing glycerol	110
Lipids not containing glycerol	115
Lipids as amphiphiles: micelles and bilayers	120
<b>8. The Nucleic Acids</b>	<b>126</b>
Components of nucleic acids	126
Structure of deoxyribonucleic acids	130
Double-helical structure of DNA	136
Proteins associated with DNA	149
Structure of ribonucleic acids	151
<b>9. Method of Separation and Purification of Compounds from Biological Sources</b>	<b>156</b>
The Problems of purification	156
Chromatography	161
Electrophoresis	171
Criteria of purity	174

<b>Part Two Catalysis</b>	
<b>10. Enzymes I</b>	<b>179</b>
General nature of enzymes	179
Nomenclature and classification of enzymes	183
Cofactors and coenzymes	184
Kinetics of enzymic reactions	184
Inhibition of enzymes	194
Metabolic inhibitors: antimetabolites	198
Regulation of enzymic activity	199
<b>11. Enzymes II</b>	<b>210</b>
Substrate specificity of enzymes	210
Mechanisms of rate enhancement of chemical reactions by enzymes	212
Nature of active sites and enzymic mechanisms	220
<b>Part Three Metabolism</b>	
<b>12. Introduction to Metabolism: Principles of Bioenergetics</b>	<b>241</b>
Thermodynamic principles	242
Oxidation-reduction reactions	247
High-energy phosphate compounds	250
Energy requirements	255
Mechanisms regulating metabolism	258
Experimental approaches to the study of metabolism	262
<b>13. Membranes and Subcellular Organelles</b>	<b>268</b>
Functions of membranes and subcellular organelles	268
Composition of membranes	271
Structure of membranes	272
Asymmetry of membranes	278
Assembly of membranes	281
Intracellular fibrillar structures	285
<b>14. Receptors and Transport</b>	<b>289</b>
Receptors	289
Transport	302
<b>15. Biological Oxidations I</b>	<b>316</b>
Oxidative enzymes and coenzymes	317
The citric acid cycle	323
Mitochondrial structure	332
Electron transport	337
Oxidative phosphorylation	344
Mechanism of oxidative phosphorylation	348
<b>16. Biological Oxidations II: Oxidative Enzymes, Coenzymes, and Carriers</b>	<b>357</b>
Nicotinamide adenine nucleotides	358
Flavoproteins	361
Proteins containing iron-sulfur centers	364
Cytochromes	367
Oxidases, oxygenases, and hydroxylases	377
Peroxide and superoxide	381
<b>17. Carbohydrate Metabolism I</b>	<b>385</b>
Carbohydrate metabolism: an overview and some general principles of metabolism	385
Cellular uptake and production of glucose	389
Glycolysis	393
Anaplerosis: pyruvate and oxaloacetate metabolism	408
Regulation of glycolysis and gluconeogenesis	411
The Phosphogluconate oxidative pathway	414
Some specialized pathways of carbohydrate metabolism in plants and microorganisms	417

<b>18. Carbohydrate Metabolism II</b>	<b>424</b>
Polysaccharides as energy reserves: glycogen	428
Glycogen metabolism	428
Glycogen synthesis	430
Blood glucose and regulation of glucose metabolism	447
Hexose interconversions	449
Biosynthesis of oligosaccharides	456
Biological roles of glycoproteins and glycolipids	463
Microbial cell walls	469
<b>19. Carbohydrate Metabolism III</b>	<b>478</b>
The chloroplast	479
Fixation of CO <sub>2</sub>	480
Carbohydrate synthesis	481
The photosynthetic process	489
<b>20. Lipid Metabolism I Triacylglycerols</b>	<b>508</b>
Intestinal absorption of lipids	508
Plasma lipoproteins and lipid transport	509
Outline of triacylglycerol metabolism	512
Lipids of the body	512
Oxidation of fatty acids	513
Synthesis of fatty acids	522
Fatty acid interconversions	529
Synthesis of triacylglycerols	532
Regulation of lipid metabolism	534
Energetic aspects of lipogenesis from carbohydrate	535
Mobilization of depot and liver lipid	538
Dietary status and hepatic metabolism of fatty acids	542
Metabolism of ethanol and alcoholism: relationship to lipid metabolism	543
<b>21. Lipid Metabolism II</b>	<b>545</b>
The phosphoglycerides	545
Sphingolipids	553
Glycosphingolipids	554
Cholesterol metabolism and its controls	558
Incorporation of amphipathic lipids in membranes	569
<b>22. Amino Acid Metabolism I : Plants and Microorganisms</b>	<b>571</b>
Fixation of nitrogen	571
Fixation of ammonia	575
Fixation of sulfur	578
Amino acid synthesis	580
<b>23. Amino Acid Metabolism II: Mammals</b>	<b>599</b>
Transport of amino acids	600
Amino acids nutritionally essential for human beings	601
Metabolic origins of nutritionally nonessential amino acids	604
Metabolism of one carbon-compounds	607
Metabolism of ammonia	613
Urea synthesis : the urea cycle	615
Overall aspects of amino acid metabolism	619
<b>24. Amino Acid Metabolism III</b>	<b>622</b>
Synthesis of oligopeptides	622
Detoxification: N-acylamino acids and mercapturic acids	625
Transamidation-creatine biosynthesis	627
Transmethylation	628
Biosynthesis of tetrapyrroles: heme synthesis	631
Amino acid decarboxylation	637

Polyamines	641
<b>25. Amino-Acid Metabolism IV: Fates in Mammals</b>	<b>646</b>
Glycogenic and ketogenic amino acids	646
Amino acid metabolism in human tissues	647
Metabolic fates of individual amino acids	649
<b>26. Metabolism of Purine and Pyrimidine Nucleotides</b>	<b>672</b>
Synthesis of purine and pyrimidine nucleotides	672
Formation of deoxyribo nucleotides	681
Synthesis of nucleotide coenzymes	685
Degradation of purine and pyrimidine nucleotides	688
<b>Part Four Molecular Genetics</b>	
<b>27. The Gene and Its Replication</b>	<b>699</b>
The gene as DNA	699
Semiconservative replication of DNA	700
Enzymes of DNA replication	704
Repair of DNA	715
Genetic recombination	719
Modification and restriction of DNA	721
Plasmids	722
Isolation of genes by cloning recombinant DNA molecules constructed in vitro	724
<b>28. Gene Expression and Its Control: Prokaryotes</b>	<b>727</b>
The gene and protein synthesis	727
Components of the translation mechanism	728
Mechanism of translation	734
The genetic code	739
Transcription	745
Processing of RNA transcripts	745
Colinearity of the genetic map and amino acid sequence in prokaryotes	751
Control of protein synthesis	753
Synthesis and cloning of genes	759
<b>29. Gene Expression and Its Control: Eukaryotes</b>	<b>763</b>
Structure of eukaryotic chromosomes	764
Sequence arrangements in eukaryotic DNA	766
Transcription of eukaryotic genomes	771
Regulation of gene expression	778
Molecular genetics of hemoglobin	784
The cell cycle	788
<b>30. Viruses</b>	<b>791</b>
Virus multiplication cycle	791
Double-stranded DNA viruses	793
Single-stranded DNA viruses	800
RNA viruses	802
The interferons	810
<b>31. Molecular Evolution</b>	<b>813</b>
Amino acid substitution and protein function	814
Evolution and protein structure	815
Expression of evolutionary factors	826
Population variation and survival value	827
Hereditary disorders of metabolism	828
