

CONTENTS

1 Introduction	1
2 Food-borne bacteria	5
2.1 Intoxications by pre-formed toxin	6
2.2 Infections	8
2.3 Antigenic structures	14
3 Historical aspects	22
3.1 Use of antibodies in microbiology	22
3.2 Traditional culture methods for bacteria	23
3.3 Detection of toxins by traditional methodology	24
3.4 A new perspective on detection of bacteria?	24
4 Food as an assay matrix	26
4.1 Physical and chemical properties of food	26
4.2 Microbial flora of food	28
5 Antibody technology	29
5.1 Immunization protocols	29
5.2 Polyclonal antibodies	31
5.3 Monoclonal antibodies	33
5.4 Antibody production by genetic manipulation techniques	37
5.5 Analyte-antibody binding mechanisms	40
5.6 Phase separation systems	45
5.7 End-point detection systems	47
5.8 Immunoassay formats	51
5.9 Application to food samples	67
6 Equipment and instrumentation	72
6.1 Equipment available	72
6.2 Data gathering, storage and processing	76
7 Assessment of assay performance	78
7.1 Sources of error in assays	78
7.2 Validation and quality control	80
7.3 Relative costs of immunoassays	82
7.4 Limitations of immunoassays	84
8 Assays available commercially	86
8.1 ELISAs	86
8.2 Other formats	89
9 Conclusions	91
9.1 Future impact of new technology	93

9.2 Future impact of new technology	94
Appendices	96
1 Definition of terms used	96
2 Hapten conjugation methods	99
3 Preparation of antigenic structures from bacterial cells	100
4 Monoclonal antibody techniques	102
5 Enzyme/substrate systems	105
6 Antibody labelling methods	107
7 Immunoassay reagents and methods	109
8 Preparation of immunoaffinity columns	112
9 Suppliers of equipment and consumables	113
References	120
Index	124
