

CONTENTS

Preface	ix
1. Photosystem II inhibiting chemicals : molecular interaction between inhibitors and a common target	1
2. Binding sites associated with inhibition of photosystem II	23
3. Identification of the receptor site for triazine herbicides in chloroplast thylakoid membranes	37
4. The role of light and oxygen in the action of photosynthetic inhibitor herbicides	57
5. Interaction of herbicides with cellular and liposome membranes	79
6. Effects of herbicides on the lipid composition of plant membranes	97
7. Mode of action of herbicidal bleaching	111
8. Proposed site(s) of action of new diphenyl ether herbicides	131
9. Bioregulation of pigment biosynthesis by onium compounds	153
10. Biochemical effects of glyphosate [<i>N</i> -(phosphonomethyl)glycine]	175
11. Determining causes and categorizing types of growth inhibition induced by herbicides	207
12. Modes of herbicide action as determined with <i>chlamydomonas reinhardtii</i> and coulter counting	231
13. Use of <i>chlorella</i> to identify biochemical modes of action of herbicides	251
Index	261
