

CONTENTS

1. Chemically Modified Surfaces in Catalysis	1
2. Preparation and Characterization of Poly(styrene-divinylbenzene)-Supported Catalysts	9
3. Polymeric Cofactors for Homogeneous Rhodium(I) Catalyzed Alkene Hydrogenations	31
4. Reactive Organic Functional Groups Covalently Bound on Polymeric Supports and Solid Surfaces	43
5. Chemically Modified Conducting Polypyrrole Film Electrodes	65
6. Simulation of the Cyclic Voltammetric Characteristics of a Second Order EC Catalytic Mechanism	71
7. Chemically Derivatized Semiconductor Photoelectrodes	99
8. Transfer of Solution Reactivity Properties to Electrode Surfaces	133
9. Reductive Chloride Ion Loss and Electropolymerization Techniques in Preparing Metallopolymer Films on Electrode Surfaces	159
10. Chemical Modification of TiO ₂ Surfaces with Methylsilanes and Characterization by IR Absorption Spectroscopy	185
11. Electrochemistry of Silane-Derivatized Iridium	197
12. Improvements in photoelectrochemical and Electrochromic Reactions at Chemically Modified Electrodes	205
13. Derivatized Layered M(IV) Phosphonates	223
14. Intercalation of Molecular Catalysts in Layered Silicates	241
15. Selectivity Aspects of the Fischer-Tropsch Synthesis with Supported Iron Clusters	255
16. Reactivity of Catalysts Derived from Organometallics Directly Deposited on Supports	267
17. Silacrowns, A New Class of Immobilizable Phase Transfer Catalysts	281
Index	295
