

CONTENTS

Mercury in the sea environment in the circumstance of Japan	1
Studies on the distribution of mercury in several body organs – Application of actinography to Examination of mercury distribution of Minamata disease patients	5
Studies on the methyl mercury formation in the environment	10
Mercury content; Normal human tissues	20
Minamata disease in chronic occurrence from pathological viewpoints	28
Long-term studies on the neurotoxicity of small amount of methylmercury in monkeys (First report)	63
The neuropathology of alkylmercury intoxication in humans with especial reference to cerebellar Involvement Ina comparison with the whole body autoradiographic studies in experimental Animals	71
Methylmercury inhibition of protein synthesis in brain tissues. 1. Effects of methylmercury and Heavy metals on cell-free protein synthesis in rat brain and liver	129
Intracellular distribution of ²⁰³ Hg-labelled methylmercury chloride in rat tissues	137
Autoradiographic demonstration of cellular localization of methyl mercury. 2. Methyl mercury Accumulating cells in the mouse adrenal gland	149
Is methylcobalamin along with inorganic mercury toxic in inducing mercury poisoning? Pharmacological and patthological studies in rats	152
Diagnostic problems in Minamata Disease	154
Dose-response relationship of methyl mercury	159
Minamata disease with a long-term follow-up	167
The diagnosis of Minamata disease using a multivariant analysis of all neurological symptoms of In polluted areas	175
The late onset of organic mercury intoxication after exposure	178
The late onset of organic mercury intoxication after exposure	178
Minamata disease and urinary excretion of β 2 microglobulin	180
Abnormalities in sural nerve action potentials recorded from methyl mercury poisoned patients	182
Otorhinolaryngological aspects of intoxication by organic mercury compounds	186
Neuroophthalmological findings of organic mercury poisoning “Minamata Disease” in Niigata Prefecture	202
