

CONTENTS

1. Unresolved Structure-Activity Relationships in Anthracycline Analogue Development	1
2. Non-Cross-Resistant Anthracyclines with Reduced Basicity and Increased Stability of the Glycosidic Bond	14
3. Fluorinated Anthracyclones and Their Glycosylated Products	47
4. Semisynthetic Rhodomycins and Anthracycline Prodrugs	59
5. Synthetic Options for Reversal of Anthracycline Resistance and Cardiotoxicity	78
6. Synthesis and Biological Activities of Fluorinated Daunorubicin and Doxorubicin Analogues	100
7. Redox Chemistry of Anthracyclines and Use of Oxomorpholinyl Radicals	115
8. Synthesis of Anthraquinone Analogues of Linked Anthracycline	132
9. Synthesis and Study of Structure-Activity Relationships of New Classes of Anthracyclines	142
10. Molecular Recognition of DNA by Daunorubicin	156
11. Adducts of DNA and Anthracycline Antibiotics: Structures, Interactions, and Activities	168
12. DNA Topoisomerases and Their Inhibition by Anthracyclines	183
13. Anthracycline Antihelicase Action: New Mechanism with Implications for Guanosine-Cytidine Intercalation Specificity	204
14. Membrane biophysical Parameters Influencing Anthracycline Action	222
15. Signal Transduction Systems in Doxorubicin Hydrochloride Mechanism of Action	241
16. Analysis of Multidrug Transporter in Living Cells: Application to Uptake and Release of Anthracycline Derivatives by Drug-Resistant K562 Cells	248
17. Role of Reactive-Oxygen Metabolism in Cardiac Toxicity of Anthracycline Antibiotics	259
18. Amelioration of Anthracycline-Induced Cardiotoxicity by Organic Chemicals	268
19. Use of Drug Carriers To Ameliorate the Therapeutic Index of Anthracycline Antibiotics	300
Author Index	320
Affiliation Index	321
Subject Index	321
