

CONTENTS

Introduction	1
Chapter 1 Experimental study of thermal decomposition	3
1.1 The basic methods of thermal analysis	3
1.2 The measurement error of specimen temperature	4
1.3 The reference temperature of measurements	9
1.4 Thermogravimetric techniques with a stage of isothermal specimen heating	11
1.5 Approximative description of isothermal decomposition of solid matter by a kinetic equation of a one-stage chemical reaction (OCR)	16
1.6 Dynamic thermal analysis of thermal decomposition	19
1.7 Approximate empirical description of TG curves of solid substances by the OCR kinetic equation	21
1.8 Linear pyrolysis (or linear thermolysis)	25
References	43
Chapter 2 Changes in the mass, density and thermophysical properties of solids during their thermolysis	44
2.1 Constructing a comprehensive mathematical model of thermal composition of solids	44
2.2 Avrami method. The KEKAM equation	48
2.3 The thermal analysis of natural coals and charring polymers	50
2.4 TG curves of complex compounds at high temperatures and heating rates	52
2.5 TG behaviour with changing heating rates	55
2.6 Simple semi-empiric equations describing the limited shift of TG curves towards an ultimate graph	58

VI

2.7	The impact of thermal decomposition of unfilled materials on their thermophysical properties	63
	References	70
Chapter 3 Physical models of dynamic decomposition		71
3.1	The stability loss temperature of anharmonic oscillators	71
3.2	The temperature ranges of chemophase transitions due to fast heating.	74
3.3	The influence of macromolecular structure on the temperature boundaries of decomposition	78
3.4	The analytical description of ultimate TG curves of more complicated structures	85
3.5	The structural dependence of thermal stability under instant heating conditions	87
	References	90
Chapter 4 A thermodynamic approach to the characteristic temperatures of thermal decomposition of condensed materials		91
4.1	Phase equilibrium conditions in a one-component system	91
4.2	The conditions of stable internal phase equilibrium	94
4.3	The condition of phase equilibrium in multi-component systems	97
4.4	The maximum overheating temperature of a metastable liquid	113
4.5	The limiting temperatures of thermal decomposition of linear polymers and crystalline hydrates	121
4.6	Surface phenomena and the maximum overheating temperature	128
	References	132
Chapter 5 The kinetics of physico-chemical transformations in the thermal decomposition of materials		134
5.1	Kinetics of evaporation, sublimation and desorption. Thermal model ..	134
5.2	Kinetics of evaporation and sublimation. A gas-dynamic model	146
5.3	Kinetic conditions of chemical equilibrium in the case of thermolysis ..	149

5.4	Thermolysis of materials having a complex chemical composition by employing a wide range of heating rates	156
5.5	Thermodestruction of oligomers and polymers	162
5.6	Practical methods for describing the termolysis of substances with a complex chemical composition and mixtures	174
	References	182
Chapter 6 Thermophysical properties of heterogeneous materials		183
6.1	Thermal conductivity of anisotropic materials	183
6.2	The main thermal conductivity coefficients of bodies with cylindrical inclusions	185
6.3	Thermal conductivity coefficients of complex structures	191
6.4	The thermal expansion behaviour of plastics	197
6.5	Thermal expansion of composites with complex reinforcement patterns .	206
	References	208
Chapter 7 Experimental determination of thermal characteristics of decomposing materials		209
7.1	General. Classification of methods for the determination of thermal characteristics	209
7.2	Main changes in thermal properties of materials at different heating stages	221
7.3	Determination of thermal properties of decomposing materials on short-term heating	225
7.4	Effects of elevated pressure of the gaseous medium on thermal characteristics of decomposing materials	229
7.5	Comprehensive program for determination of thermal properties of decomposing materials	231
	References	233

VIII

Chapter 8	Changes in the physico-mechanical properties of materials during their thermal decomposition	235
8.1	Rheological models of a reacting medium	235
8.2	Nonstationary temperature stresses in decomposing materials	239
8.3	Strength of materials during irregular heating	241
8.4	Effect of the thermolysis of a material on its strength	245
8.5	Methods for calculating nonstationary temperature fields	253
	References	255
Chapter 9	Practical utilization of thermal decomposition laws of solids in some thermal calculations	256
9.1	Conditions for beginning of self-excitation of the decomposition process in thermally unstable solids	256
9.2	Calculation of heat conduction processes in thermal insulation coatings	262
9.3	Mathematical modelling of detonation processes in condensed materials taking into account the finite heat propagation rate	263
9.4	Modelling of front thermal decomposition processes defined by transformation kinetics	268
9.5	Generalized description of dynamic thermal decomposition processes in condensed media	270
9.6	Description of linear pyrolysis and ablation at high intensity of thermal flows	274
9.7	Use of carbon thermolysis in solid fuel processing	279
9.8	Conclusion	281
	References	283
	Index	285
