

CONTENTS

1. Viscoelastic Behavior of Polymeric and Composite Materials and the Principles of Prediction	1
1.1 Principles of Prediction and Time Analogies	1
1.2 Prediction of the Effect Elastic and Viscoelastic Characteristics of Dispersion-Filled Composite Materials	7
1.3 Application of Theory to the Prediction of Viscoelastic Properties of Polymer Composites (ABS Plastics and ASA Copolymers)	16
1.4 composite Materials Based on Blends of Crystalline Polymers	28
1.5 Cynamic Mechanical Properties of Interpenetrating Polymer Networks	37
1.6 Acoustic Properties and Volumetric Characteristics of Composite Materials	45
1.7 Influence of Pressure on the Effective Elastic properties of Polymeric Materials	54
1.8 Acoustic Properties and Compressibility of Heat Stable Polymers	58
1.9 Dynamic Volume Elastic Moduli and Poisson Ratios of Amorphous and Partially Crystalline Polymers in Hydrostatic Compression	63
2. Prediction of Deformation Properties	69
2.1 General Remarks	69
2.2 Time-Temperature Superposition	72
2.3 Estimation of Time-Temperature Superposition Parameters for Thermorheological Simple Bodies	77
2.4 Experimental Results for Semicrystalline Polymers and the Nonlinear Viscoelastic Approximation	82
3. Complex Thermorheological Behavior and the Complex Stress State	95
3.1 Determination of Time-Temperature Superposition for Thermorheologically Complex Bodies	95
3.2 Experimental Results for Composite Materials	100
3.3 Prediction of Long-Term Deformation Resistance in Complex Stress States	126
3.4 effect of Stress State on the Yield Point and Plastic Deformation Mechanism	143
4. Prediction of Volumetric Creep Deformation of Polymeric Materials	151
4.1 Introductory Remarks	151
4.2 Stress-Time Superposition	153
4.3 Mechanical Models for Different Stress States	155
4.4 Prediction of Volumetric Creep	160
4.5 Approximation of Physically Nonlinear Volumetric Creep	164
4.6 The Use of Fractional Exponent Power Law Functions to Approximate Generalized Creep Curves	170

5. Prediction of Creep of Polymeric and Composite Materials in Shear and Tension Under Hydrostatic Pressure	183
5.1 Experimental Results	183
5.2 Comparison of Predictions of Creep Deformation by Time-Temperature and Pressure Time Superposition	190
5.3 Approximation of Nonlinear Viscoelasticity in Simple and Complex Stress States	195
5.4 Nonisobaric, Nonstatic Deformation	198
5.5 Stress Relaxation Under Hydrostatic Pressure (Isothermal and Isochoric Regimes of Shear Strain)	213
5.6 Calculation of Time-Temperature Superposition Parameters for Thermorheologically Complex Behavior	227
5.7 Prediction of Relaxation Modulus of Polymer Blends Based on High-and Low-Density Polyethylenes	232
5.8 Volume Changes and Deformation Mechanisms in Composite Materials	237
5.9 Prediction of Deformation Properties in Accelerated Quasi-Static Tests	244
6. Long-Term Strength	253
6.1 Long-Term Strength in Simple Stress States at Varying Temperatures	253
6.2 Prediction of Long-Term Strength	260
6.3 Prediction of Long-Term Strength in Surface-Active Media	265
6.4 The Method of Time-Temperature Superposition	270
6.5 Brittle and Ductile Failure of Polymers	277
6.6 Kinetics of Defect Accumulation in Polymers under Load	281
6.7 Models of Failure Encompassing Defect Accumulation	297
6.8 Statistical Properties of Long-Term Strength	306
6.9 Models of Delayed Failure	308
References	319
