

## Contents

Introduction	1
Definitions and legal considerations	3
Biodegradable and/or compostable	4
Edible and/or biodegradable	5
The quest for sustainability. Drivers for biodegradable materials	5
Waste generation	6
Oil prices and shortage of resources	6
Reduction of carbon footprint and energy consumption	7
Evaluation of biodegradable materials	7
Stability and safety during shelf life	7
Loss of properties of the material	7
Growth of microorganisms	8
Food packaging interactions	9
Processability and poor performance	9
Price and technological development	10
Environmental impacts	11
Other impacts	12
Disposal of biodegradable polymers	13
Compost	13
Landfill	14
Consumers' role	15
Types of biodegradable materials	16
Films and coatings obtained from renewable resources	17
Category 1: Polymers directly extracted from biomass	17
Polysaccharides	17
Proteins	21
Lipids	24
Category 2: Polyesters directly produced by natural or GM organisms	25
Category 3: Biodegradable polymers obtained by synthesis	27
Poly(lactic acid) (poly(lactinide) or PLA)	27
Other polyesters	29
Copolymers from CO <sub>2</sub>	30
Synthetic biodegradable options not obtained from non-renewable resources	30
Polycaprolactone (PCL)	31
Poly(vinyl) alcohol (PVOH)	31
Additives to make conventional plastics biodegradable	32
Biodegradable plastics market	33
Suppliers	33
Examples already in the supermarkets: The retailer role	34
Conclusions	35
Appendix 1: Glossary of terms and abbreviations	37
Appendix 2: Definitions	38
Appendix 3: British Standards describing how to evaluate biodegradability	40
Appendix 4: Literature References	41
