

CONTENTS

	Page
1. Sampling	1
1.1 Introduction	1
1.2 Discussion of the problem	5
1.3 Conclusions	6
1.4 Sampling from analysis sample	7
1.5 Sampling and sizing from mists and dusty atmospheres	7
2. Particle size, shape and distribution	16
2.1 Particle size	16
2.2 Particle shape	17
2.3 Shape factors	18
2.4 Average diameters	21
2.5 Method of presenting size analysis data	25
2.6 Devices for representing the cumulative distribution curve as a straight line	28
2.7 The law of compensating errors	31
3. Sieving	34
3.1 Introduction	34
3.2 Type of sieves	35
3.3 British Standard specifications	35
3.4 Method for the use of fine mesh sieves	36
3.5 Sieving errors	37
3.6 Micromesh sieves	42
3.7 Wet sieving	42
3.8 Calibration of sieves	43
3.9 Conclusion	43
4. Microscopy	45
4.1 Preparation of slides	45
4.2 Particle size	46
4.3 Method of sizing particles	48
4.4 Statistical considerations governing the determination of size distributions by microscope count	53
4.5 Training of operators	54
4.6 Automatic sizing and counting	55
4.7 Electron microscopy	56
5. Interaction of particles and fluids in a gravitational field	62
5.1 Introduction	62
5.2 The steady-state equation of motion for a sphere	62
5.3 Terminal velocity outside the Stokes' region	64
5.4 Non-spherical particles	69
5.5 Particle acceleration	70
5.6 Errors due to the finite extent of the fluid	71
5.7 Discontinuity of the fluid	72
5.8 Viscosity of a suspension	72
5.9 Deviations due to proximity of adjacent particles	72
5.10 Non-rigid spheres	73
5.11 Hindered settling	73
6. Incremental methods of sedimentation size analysis	79
6.1 Basic theory	79

6.2	Resolution for incremental methods	81
6.3	The pipette method	82
6.4	Hydrometers	86
6.5	Divers	88
6.6	The specific gravity balance	90
7.	Cumulative methods of sedimentation size analysis	92
7.1	Introduction	92
7.2	Two-layer methods	92
7.3	Homogeneous suspensions	93
7.4	Apparatus	96
7.5	Discussion	104
7.6	Appendix : An approximate method of calculating size distribution from cumulative sedimentation results	105
8.	Elutriation	110
8.1	Introduction	110
8.2	Theory	111
8.3	Water elutriators	113
8.4	Air elutriators	116
8.5	Centrifugal elutriators	118
9.	Centrifugal methods	121
9.1	Introduction	121
9.2	General theory	121
9.3	Two-layer technique	122
9.4	Homogeneous suspension	128
9.5	Cumulative sedimentation theory	128
9.6	Variable time method (variation of p with t)	128
9.7	Variable inner radius (variation of p with S)	129
9.8	Shape of centrifuge tubes	130
9.9	Alternative theory (variation of p with S)	131
9.10	Variable outer radius	132
9.11	Incremental analysis with a homogeneous suspension	133
9.12	The supercentrifuge	137
9.13	The ultracentrifuge	140
9.14	Conclusion	140
10.	The Coulter counter	143
10.1	Introduction	143
10.2	Operation	144
10.3	Evaluation of results	144
10.4	Theory	147
10.5	Errors associated with the Coulter technique	149
11.	Light-scattering methods of particle size determination	154
11.1	Introduction	154
11.2	Particles small compared with the wavelength of light	155
11.3	Particles of the same order of size as the wavelength of light	157
11.4	High-order Tyndall spectra	162
11.5	Light-scattering equipment	163
11.6	The photosedimentation technique	164
12.	Permeametry	171
12.1	Flow of viscous fluid through a packed bed	171
12.2	Alternative derivation of Kozeny's equation using equivalent capillaries	173
12.3	Correction for compressible fluids	173
12.4	Types of flow	174
12.5	Transitional region	174

12.6	Molecular flow	175
12.7	Experimental techniques for determining Z	176
12.8	Calculation of permeability surface	177
12.9	Experimental applications	177
12.10	Transient flow for fine particle measurement	182
12.11	The liquid phase permeameter	184
12.12	Other flow equations	186
12.13	Limitations of theory	187
13.	Gas adsorption	190
13.1	Introduction	190
13.2	Theories of adsorption	191
13.3	Experimental techniques-factors affecting adsorption	200
13.4	Experimental techniques-volumetric methods	201
13.5	Experimental techniques-gravimetric methods	205
13.6	Experimental techniques-continuous flow methods	207
13.7	Commercially available apparatus	211
13.8	Standard gas adsorption apparatus	212
13.9	Description of continuous flow apparatus	218
14.	Other methods for determining surface area	222
14.1	Introduction	222
14.2	Measurement of surface area from liquid phase adsorption	222
14.3	Adsorption of dyes	224
14.4	Heat of adsorption for surface area determination	224
15.	Determination of pore size distribution	227
15.1	Miscellaneous techniques	227
15.2	Gas adsorption methods	227
15.3	The mercury porosimeter	233
	Index	241
