620.43 ALL 3d ed.

CONTENTS

		Page
1.	**Sampling powders**	**1**
1.1	Introduction	1
1.2	Theory	1
1.3	Golden rules of sampling	5
1.4	Bulk sampling	5
1.5	Slurry sampling	20
1.6	Sample dividing	22
1.7	Miscellaneous devices	28
1.8	Reduction from laboratory sample to analysis sample	30
1.9	Reduction from analysis sample to measurement sample	32
1.10	Experimental tests of sample-splitting techniques	33
2.	**Sampling of dusty gases in gas streams**	**36**
2.1	Introduction	36
2.2	Basic procedures	39
2.3	Sampling equipment	41
2.4	Corrections for anisokinetic sampling	54
2.5	Probe orientation	59
2.6	Radiation methods	60
3.	**Sampling and sizing from the atmosphere**	**64**
3.1	Introduction	64
3.2	Inertial techniques	68
3.3	Filtration	77
3.4	Electrostatic precipitation	79
3.5	Electrical charging and mobility	81
3.6	Thermal precipitation	82
3.7	The quartz microbalance	86
3.8	Light scattering	86
3.9	Miscellaneous techniques	95
4.	**Particle size, shape and distribution**	**103**
4.1	Particle size	103
4.2	Particle shape	107
4.3	Determination of specific surface from size distribution data	121
4.4	Particle size distribution transformation between number, surface and mass	122
4.5	Average diameters	124
4.6	Particle dispersion	129
4.7	Methods of presenting size analysis data	130
4.8	Devices for representing the cumulative distribution as a straight line	133
4.9	The low of compensating errors	146
4.10	Alternative notation for frequency distribution	149
4.11	Phi-notation	156
4.12	Manipulation of the log-probability equation	157
4.13	Relationship between median and mode of a log-normal distribution	161
4.14	An improved equation and graph paper for log0normal evaluations	161
5.	**Sieving**	**165**
5.1	Introduction	165
5.2	Woven-wire and punched plate sieves	166
5.3	Electroformed micromesh sieves	167
5.4	British Standard specification sieves	169

5.5 Method for the use of fine sieves 171
5.6 Sieving errors 178
5.7 Mathematical analysis of the sieving process 180
5.8 Calibration of sieves 183

6. Microscopy 187
6.1 Introduction 187
6.2 Optical microscopy 187
6.3 Particle size 188
6.4 Transmission electron microscopy (TEM) 192
6.5 Scanning electron microscopy (SEM) 196
6.6 Manual methods of sizing particles 197
6.7 Semi-automatic aids to microscopy 201
6.8 Automatic counting and sizing 207
6.9 Quantitative image analysers 208
6.10 Specimen improvement techniques 209
6.11 Statistical considerations governing the determination of size distributions by microscope count 210
6.12 Conclusion 211

7. Interaction between particles and fluids in a gravitational field 215
7.1 Introduction 215
7.2 Relationship between drag coefficient and Reynolds number for sphere settling in a liquid 216
7.3 The laminar flow region 217
7.4 Critical diameter for laminar flow settling 218
7.5 Particle acceleration 219
7.6 Errors due to the finite extent of the fluid 220
7.7 Errors due to discontinuity of the fluid 222
7.8 Brownian motion 223
7.9 Viscosity of a suspension 225
7.10 Calculation of terminal velocities in the transition region 225
7.11 The turbulent flow region 229
7.12 Non-rigid spheres 230
7.13 Non-spherical particles 231
7.14 Concentration effects 235
7.15 Hindered settling 240
7.16 Electro-viscosity 243

8. Dispersion of powders 246
8.1 Discussion 246
8.2 The use of glidants to improve flowability of dry powders 252
8.3 Density determination 252
8.4 Viscosity 256
8.5 Sedimentation systems 256
8.6 Densities and viscosities of some aqueous solutions 261
8.7 Standard powders 262

9. Incremental methods of sedimentation size analysis 267
9.1 Basic theory 267
9.2 Resolution for incremental methods 269
9.3 The pipette method 270
9.4 The photosedimentation technique 276
9.5 X-ray sedimentation 283
9.6 Hydrometers 287
9.7 Divers 289
9.8 The specific gravity balance 291
9.9 Appendix : worked examples 291

10. Cumulative methods for sedimentation size analysis 298

10.1 Introduction 298
10.2 Line-start methods 298
10.3 Homogeneous suspensions 299
10.4 Sedimentation balances 301
10.5 The granumeter 308
10.6 The micromerograph 308
10.7 Sedimentation columns 310
10.8 Manometric methods 314
10.9 Pressure on the walls of the sedimentation tube 315
10.10 Decanting 315
10.11 The β-back –scattering method 317
10.12 Discussion 318
10.13 Appendix : An approximate method of calculating size distribution from cumulative sedimentation results 319

11. Fluid classification 325
11.1 Introduction 325
11.2 Assessment of classifier efficiency 325
11.3 Systems 331
11.4 Counterflow equilibrium classifiers in the gravitational field-elutriators 331
11.5 Cross-flow gravity classifiers 341
11.6 Counterflow equilibrium classifiers in the centrifugal field 343
11.7 Cross-flow equilibrium classifiers in the centrifugal field 344
11.8 Other commercially available classifiers 347
11.9 Hydrodynamic chromatography 347

12. Centrifugal methods 350
12.1 Introduction 350
12.2 Stokes' diameter determination 350
12.3 Line-start technique 351
12.4 Homogeneous suspension 359
12.5 Cumulative sedimentation theory for a homogeneous suspension 360
12.6 Variable-time method (variation of P with t) 361
12.7 Variable inner radius (variation of P with S) 362
12.8 Shape of centrifuge tubes 363
12.9 Alternative theory (variation of P with S) 364
12.10 Variable outer radius (variation of P with R) 365
12.11 Incremental analysis with a homogeneous suspension 365
12.12 The LADAL X-ray centrifuge 372
12.13 The LADAL pipette withdrawal centrifuge 377
12.14 The supercentrifuge 382
12.15 The ultracentrifuge 384
12.16 Conclusion 384
12.17 Appendix : Worked examples 386

13. The electrical sensing zone method of particle size distribution determination (the Coulter principle) 392
13.1 Introduction 392
13.2 Operation 392
13.3 Calibration 393
13.4 Evaluation of results 396
13.5 Theory 397
13.6 Effect of particle shape and orientation 400
13.7 Coincidence correction 401
13.8 Pulse shape 404
13.9 End-point determination 407
13.10 Upper size limit 408
13.11 Commercial equipment 408
13.12 Conclusions 411

14. Radiation scattering methods for particle size determination **414**
14.1 Introduction 414
14.2 Scattered radiation 418
14.3 State of polarization of the scattered radiation 420
14.4 Turbidity measurement 421
14.5 High-order Tyndall spectra (HOTS) 423
14.6 Particle size analysis by light diffraction 424
14.7 Light-scattering equipment 425
14.8 Holography 426
14.9 Miscellaneous 428

15. Permeametry and gas diffusion **432**
15.1 Flow of a viscous fluid through a packed bed of powder 432
15.2 Alternative derivation of Kozeny's equation using equivalent capillaries 434
15.3 The aspect factor k 435
15.4 Other flow equations 436
15.5 Experimental applications 440
15.6 Preparation of powder bed 441
15.7 Constant-pressure permeameters 441
15.8 Constant-volume permeameters 445
15.9 Fine particles 448
15.10 Types of flow 449
15.11 Transitional region between viscous and molecular flow 449
15.12 Experimental techniques for determining Z 450
15.13 Calculation of permeability surface 451
15.14 Diffusional flow for surface area measurements 453
15.15 The relationship between diffusion constant and specific surface 454
15.16 Non-steady-state diffusional flow 455
15.17 Steady-state diffusional flow 457
15.18 The liquid phase permeameter 460
15.19 Application to hindered settling 462

16. Gas adsorption **465**
16.1 Introduction 465
16.2 Theories of adsorption 466
16.3 Experimental techniques – factors affecting adsorption 488
16.4 Experimental techniques – volumetric methods 490
16.5 Experimental techniques – gravimetric methods 494
16.6 Continuous-flow gas chromatographic methods 496
16.7 Standard volumetric gas-adsorption apparatus 502
16.8 Commercially available volumetric-and gravimetric-type apparatus 505

17. Other methods for determining surface area **514**
17.1 Introduction 514
17.2 Calculation form size distribution data 515
17.3 Adsorption form solution 516
17.4 Methods of analysis of amount of solute adsorbed on to solid surfaces 519
17.5 Theory for adsorption from solution 521
17.6 Quantitative methods for adsorption from a solution 522
17.7 Theory for heat of adsorption from a liquid phase 526
17.8 Static calorimetry 529
17.9 Flow microcalorimetry 530
17.10 Density method
534
18. Determination of pore size distribution by gas adsorption **538**
18.1 Miscellaneous techniques 538
18.2 The Kelvin equation 538
18.3 The hysteresis loop 541
18.4 Relationship between the thickness of the adsorbed layer and the relative pressure 544
18.5 Classification of pores 546

18.6 The α_s method 546
18.7 Pore size distribution determination of mesopores 547
18.8 Analysis of micropores : the MP method 558
18.9 Miscellaneous 560

19. Mercury porosimetry **564**
19.1 Introduction 564
19.2 Literature survey 566
19.3 Contact angle and surface tension for mercury 568
19.4 Principle 569
19.5 Theory for volume distribution determination 571
19.6 Theory for surface distribution determination 574
19.7 Theory for length distribution determination 574
19.8 Worked example 576
19.9 Comparison with other techniques 578
19.10 Correction factors 579

20. On-line particle size analysis **583**
20.1 Introduction 583
20.2 Steam-scanning 583
20.3 Field-scanning 596
