PREFACE	v
PREFACE TO FIRST EDITION	vii
CHAPTER I	
ELECTROSTATIC AND ELECTROMAGNETIC THEORY	1
<p>Coulomb's Law—Electrostatic field in the neighbourhood of various systems of charged conductors—Gauss and Coulomb theorems—Potential—Capacitance—Energy stored in electric fields—Magnetism—Intensity of magnetization—Intensity of magnetic field and magnetic potential—Permeability—Magnetic fields in the neighbourhood of current-carrying conductors—Generation of e.m.f.—Energy stored in magnetic fields—Hysteresis and hysteresis loss—Formulae in rationalized form</p>	
CHAPTER II	
UNITS, DIMENSIONS, AND STANDARDS	51
<p>C.G.S. electrostatic and electromagnetic systems of units—The connections between such systems—Practical and legal units and their relationship to the absolute units—Dimensions of electrical quantities—Dimensional equations—The Giorgi (M.K.S.) system of units—Rationalized systems of units—Determination of "c"—International units and standards—Absolute measurements of international units—Concrete representation of units—Construction of standard cells and standard resistances—Resistance materials—Kelvin ampere balance—Primary and secondary standards of self- and mutual-inductance—Capacitance standards</p>	
CHAPTER III	
CIRCUIT ANALYSIS	105
<p>General rules—The various methods of symbolic representation—Applications of such methods to circuit calculations—Symmetrical components</p>	
CHAPTER IV	
CAPACITORS, CAPACITANCE, AND DIELECTRICS	126
<p>Calculation of the capacitance of various systems of charged conductors—Electrical images—Capacitors in series and in parallel—Capacitances of multi-core cables—Self-capacitance of solenoids—Guard rings and screening—Dielectrics and their properties—Permittivity—Dielectric strength—Potential gradient—Graded cables and condenser bushings—Dielectric absorption—Dielectric losses and power-factor of capacitors—The measurement of dielectric losses—The Schering bridge—Dielectric loss measurements by cathode ray oscillograph</p>	
CHAPTER V	
INDUCTANCE	170
<p>Self- and mutual-inductance—The relations between them—Calculation of the inductance of various systems of conductors—Design of inductance coils—Skin effect</p>	
CHAPTER VI	
MEASUREMENT OF INDUCTANCE AND CAPACITANCE	197
<p>Elementary methods—A.C. bridge methods—Apparatus for use in a.c. bridge methods—Sources of error in bridge measurements—Supplies for bridge networks—Variable standards of resistance, inductance, and capacitance—Detectors—Vibration galvanometers—Sensitivity</p>	

CHAPTER VII		PAGE
MEASUREMENT OF RESISTANCE		270
Classification of resistances and methods of measurement—Measurement of low resistance—Voltage drop method—Potentiometer method—Kelvin double bridge—Precautions necessary for precision measurements—Measurement of medium resistance—Substitution, differential galvanometer, and Wheatstone bridge methods—Precision forms of Wheatstone bridge—Applications of resistance measurements by Wheatstone bridge—Measurement of high resistance—Surface and volume resistivity—Insulation resistance—Meggers and ohmmers—Measurement of resistance of electrolytes—Measurement of water purity—Sensitivity and accuracy of different methods—Galvanometers and other apparatus used in connection with resistance measurements—Theory of the D'Arsonval galvanometer		
CHAPTER VIII		
POTENTIOMETERS		324
General principles—Modern forms of d.c. potentiometers—Potentiometers for special purposes—Thermo-electric potentiometers—Diesselhorst and Brooks deflectional forms—Use for the measurement of voltage, resistance, current, and power—Volt ratio boxes and other auxiliary apparatus—pH meters—A.C. potentiometers and their applications		
CHAPTER IX		
MAGNETIC MEASUREMENTS		352
Classification of magnetic measurements—Magnetometer measurements—The ballistic galvanometer, fluxmeter, and other auxiliary apparatus—Methods of calibrating ballistic galvanometers—B-H curves and permeability measurements on bars and ring specimens—Leakage factor—Hysteresis measurements—Bar and yoke methods—Permeameters—Magnetic potentiometer—Testing at very high and very low inductions—Testing of permanent magnets—A.C. magnetic tests—Power loss in sheet steel—Separation of losses—Wattmeter measurements—Iron powders—Bridge and a.c. potentiometer methods		
CHAPTER X		
ILLUMINATION		411
General considerations—Definitions—Laws of illumination—Standards of candle-power—Flame and incandescent standards—Sub-standards of candle-power—Measurement of candle-power—Photometer bench and heads—Flicker photometers—Distribution of candle-power—M.H.C.P. and M.S.C.P.—Rousseau construction—The integrating sphere—Illumination photometers—Physical photometry		
CHAPTER XI		
HIGH-VOLTAGE MEASUREMENTS AND TESTING		437
General classification and purpose of testing methods—Testing apparatus—High voltage transformers and voltage regulation—Control gear and connections—Apparatus for voltage measurement—Sphere gap—Potential dividers—Measurement of peak voltage—Rectified condenser-charging-current method—Crest voltmeters—High-voltage voltmeters—Special apparatus for tests other than low-frequency A.C. tests—Constant direct-current tests—Mechanical and valve rectifiers—Localization of faults in h.t. cables—High-frequency tests—Damped and undamped oscillations—Surge or impulse tests—Steepness of wave-front—Impulse ratio—Notes on the testing of insulators, insulating materials, and cable lengths—Nature of dielectric breakdown—Solid and liquid specimens		
CHAPTER XII		
LOCALIZATION OF CABLE FAULTS		486
Common faults in cables—Blavier and volt-drop tests—Loop tests—Murray, Varley, and Fisher loop tests—Fault-localizing bridges—Tests for open circuit faults—Induction method of testing		

CONTENTS

xi

CHAPTER XIII

PAGE

ELECTRICAL METHODS OF MEASURING TEMPERATURE . . . 498

General methods of measuring temperature—Electrical resistance pyrometers—Laws of resistance variation with temperature—Methods of using platinum resistance thermometers—Indicators and recorders—Thermoelectric pyrometers—Thermo-electric e.m.f.s—Radiation pyrometers—Stefan-Boltzmann Law of Radiation—Fixed- and variable-focus types—Optical pyrometers

CHAPTER XIV

EDDY CURRENTS . . . 518

The nature and effects of eddy currents—Eddy currents in cylindrical conductors and in thin sheets—Influence of eddy currents upon the flux distribution in iron plates—Eddy-current losses in armature conductors—Eddy-current damping with metal formers and discs

CHAPTER XV

WAVE-FORMS AND THEIR DETERMINATION . . . 535

Wave-form distortion and the composition of complex waves—Fourier's Theorem—Harmonic analysis—Perry method—Thompson and Runge method—Harmonic analyser—Shapes of current wave-forms when the voltage wave is complex—Resonance with harmonics—Virtual values and power in the case of complex wave-forms—Determination of wave-forms—Contact methods—The Ondograph—Oscillographs—Electromagnetic, electrostatic, and cathode-ray types—Theory of Duddell oscillograph and accuracy of wave-form reproduction

CHAPTER XVI

TRANSIENT PHENOMENA . . . 583

Definition—Initial conditions when a steady voltage is impressed upon, or removed from, circuits containing resistance, inductance, and capacitance—Transients when the impressed voltage is alternating—Laplace transformations

CHAPTER XVII

MEASURING INSTRUMENTS . . . 603

Classification—Absolute and secondary instruments—Indicating instruments—Control, balancing, and damping—Constructional details—Recording instruments—Quick-response recorders—Integrating instruments

CHAPTER XVIII

AMMETERS AND VOLTMETERS . . .

General considerations—Classification of instruments—Errors in ammeters and voltmeters—Moving iron instruments—Theory of attraction and repulsion types—Errors in M.I. instruments—Design data—Moving coil instruments—Permanent magnet and dynamometer types—Extension of range of moving coil instruments—Errors—Design data—Hot-wire instruments—Theory and construction—Advantages and disadvantages—Electrostatic instruments—Types—Quadrant electrometer theory—Attracted disc electrometer—Kelvin absolute electrometer—Vacuum enclosed E.S. voltmeters—Commercial forms of electrostatic voltmeters—Induction instruments—General principles—Ferraris type—Compensation for frequency and temperature errors—Shaded-pole type—Rectifier instruments—Testing sets

CHAPTER XIX

EXTENSION OF INSTRUMENT RANGE . . . 678

Ammeter shunts on d.c. and a.c.—Voltmeter multipliers—Connections of test sets—Instrument transformers—Comparison with shunts and multipliers—Current transformer theory—Ratio and phase angle errors—

CHAPTER XXI

THE MEASUREMENT OF ENERGY 771

Classification of energy meters—Electrolytic meters—Motor meters—Mercury motor meters—Errors in motor meters—Watt-hour mercury meters—Commutator meters—Grassot fluxmeter as a quantity meter—Single-phase induction type watt-hour meters—Errors in S.P. meters—Polyphase watt-hour meters—Clock meters—Remote indication—Meter testing—D.C. meter tests—Fictitious loads—Glynne electronic stabilizer—A.C. meter testing—Meters for special purposes—Prepayment meters—Maximum demand indicators—Two-rate meters—Summation metering—Measurement of kVA

CHAPTER XXII

MEASUREMENT OF SPEED, FREQUENCY, AND PHASE DIFFERENCE 819

Rotational speed measurements—Stroboscopic methods—Measurement of linear speed—Frequency standards—Frequency meters—Phase or power-factor meters—Synchroscopes

CHAPTER XXIII

ELECTRONICS AND ELECTRONIC MEASURING DEVICES 844

Physics of the thermionic valve—The diode—The triode—The tetrode—The pentode—The pentode voltage-amplifier—The thyatron—Negative feed-back—Servo-mechanisms—Velocity feed-back—Servo-systems using velocity feed-back—The cathode-follower—Applications of the cathode-follower—The differential cathode-follower—The auto-repeater—A counting-rate meter—Evershed and Vignoles quick-response recorder—The Q-meter—Electronic counters—Application of electronic counters
