

Contents

<i>Preface</i>	7
1 Introduction	9
2 New developments in materials and processes in silicon device technology	34
3 Materials for conductor elements and connections to thin films	38
4 Adhesive bonding of microelectronic packages	55
5 Application of film materials and components	59
6 Encapsulation materials: plastics	68
7 Encapsulation compatibility	83
8 Rubber seal materials	87
9 Fire-retardant thermoplastic and thermosetting materials	101
10 Structural adhesive materials	106
11 Tubing and sleeving materials	119
12 Connector materials	129
13 Metallised ceramic materials	133
14 Protective coatings for metals	137
15 Multilayer alumina circuit boards	155
16 Steatite and alumina insulators	160
17 Sealing expansion alloys	165
18 Metal plating	179
19 Electronic packaging processes with plastics	189
20 Preparing surfaces for adhesives	198
21 Packaging electronic components	203

6 *Contents*

22	Plating multilayer printed wiring boards	
23	Plated through-hole process	
24	Electrical wiring processes for panels, junction boxes and electronic equipment	
25	Cable lacing	232
25	Shrinkable sleeve assembly	236
27	Etching, cleaning and preparation	239
28	Flexible cables, printed wiring, printed circuits	
29	Materials aspects in microelectronics devices	250
30	Wafer exposure	257
31	Surface analytical techniques applied to electronic components	
32	Modern physics in semiconductor processing	
33	Microelectronic processing technology	294
34	Failure mechanisms and analysis procedures for semiconductor devices	306
	<i>Index</i>	323
