

## CONTENTS

Preface	vii
1. New developments in receptor modeling theory	1
2. The application of factor analysis to urban aerosol source resolution	21
3. Composition of source components needed for aerosol receptor models	51
4. Review of the chemical receptor model of aerosol source apportionment	75
5. The state of the art of receptor models relating ambient suspended particulate matter to sources	89
6. Air particulate control strategy development: a new approach using chemical mass balance methods	107
7. Chemical species contributions to light scattering by aerosols at a remote arid site: comparison of statistical and theoretical results	125
8. Aerosols from a laboratory pulverized coal combustor	157
9. Elemental composition of atmospheric fine particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system	173
10. Sources and fates of atmospheric polycyclic aromatic hydrocarbons	187
11. Atmospheric particulate organic matter: multivariate models for identifying sources and estimating their contributions to the ambient aerosol	197
12. An automated thermal – optical method for the analysis of carbonaceous aerosol	223
13. Wintertime carbonaceous aerosols in Los Angeles: an exploration of the role of elemental carbon	235
14. Carbonaceous urban aerosol – primary or secondary?	251
15. Comparisons between size-segregated resuspended soil samples and ambient aerosols in the western United States	269
16. Aerosol composition in relation to air mass movements in north China	287
17. Sources of airborne calcium in rural central illinois	303
18. The Effect of owens dry lake on air quality in the owens valley with implications for the mono lake area	327
Index	347
