Preface	xi
List of contributors	xiii
1. Introduction : polymer combustion, condensed phase pyrolysis and smoke formation	1
1.1 Polymers	1
1.2 Condensed-phase processes	11
1.3 Smoke	19
1.4 Conclusions	28
1.5 Bibliography	28
References	28
2. Mechanisms and modes of action in flame retardancy of polymers	31
2.1 Introduction	31
2.2 General considerations	31
2.3 Gas-phase mechanisms	32
2.4 The condensed-phase mechanism	35
2.5 Modes of action of halogen-based flame retardants : synergistic systems	39
2.6 Modes of action of phosphorus-based flame retardants	43
2.7 Modes of action of borates	55
2.8 Modes of action of metal hydroxides and other hydrated inorganic additives	56
References	57
3. Toxicity of Fire retardants in relation to life safety and environmental hazards	69
3.1 Introduction	69
3.2 Toxic combustion products from fires : general	71
3.3 Toxic effects of smoke products	76
3.4 Methods available and hazards to be assessed	78
3.5 Effects of specific fire-retardant systems	86
3.6 Conclusions	121
References	123
4. Textiles 128	
4.1 Introduction	128
4.2 Hazards and risks	128
4.3 Burning behaviour of textiles	131
4.4 Flammability testing of textiles	140
4.5 Burning and flame-retardant mechanisms	146
4.6 Cellulosic textiles	153
4.7 Flame-retardant wool and blends	157
4.8 Flame-retardant synthetic fibres	160
4.9 High heat-and flame-resistnt fibres and textiles	166
4.10 Methods of flame retardancy	169
4.11 Environmental issues	174
4.12 Conclusions	177
References	178
5. Composites	182
5.1 Introduction	182
5.2 The properties of the constituents of composites	183
5.3 Flammability of composite structures	193
5.4 Methods of imparting flame retardancy to composites	197
5.5 Conclusions : some important considerations	201

	References	201
6.	Nanocomposites	204
	6.1 Introduction	204
	6.2 The structure and properties of layered silicates	205
	6.3 The structure of nanocomposites	207
	6.4 Synthesis methods	208
	6.5 Characterisation	210
	6.6 Properties of nanocomposites	210
	6.7 The mechanism of flame retardance in nanocomposites	214
	6.8 Conclusion	217
	References	217
7.	Recent Development in flame-retarding thermoplastics and thermosets	220
	7.1 Introduction	220
	7.2 Thermoplastics versus thermosets	221
	7.3 Factors affecting flammability and its reduction	221
	7.4 Testing procedures and hazard assessments : general aspects	227
	7.5 Flame-retardant thermoplastics	229
	7.6 Flame-retardant elastomers	242
	7.7 Flame-retardant thermosets	245
	7.8 Inherently flame-retardant polymers	248
	7.9 Conclusions	249
	References	249
8.	Applications of halogen flame retardants	264
	8.1 Introduction	264
	8.2 Mechanism of flame retardancy with halogenated compounds	265
	8.3 Guidelines for choice of halogenated flame retardants	276
	8.4 New trends in halogenated flame retardants	289
	8.5 Conclusions	290
	Acknowledgements	291
	References	291
9.	Natural polymers, wood and lignocellulosic materials	293
	9.1 Combustion of natural polymers, wood and lignocellulosic materials	293
	9.2 Chemistry of fire retardancy	297
	9.3 Fire retardancy of lignocellulosic boards and panels	305
	9.4 Test methods	309
	9.5 Recent progress in fire retardants for wood and lignocellulosics	311
	References	312
10.	Intumescent materials	318
	10.1 Introduction	318
	10.2 Physical modelling of intumescent polymer behaviour in fires	319
	10.3 Chemical aspects of intumescence	325
	10.4 Intumescent systems	332
	10.5 Conclusion	332
	References	335
11.	Graft copolymerisation as a tool for flame retardancy	337
	11.1 Introduction : the production of char from polymers	337
	11.2 The importance of char	338
	11.3 Conclusion	351
	References	351
12.	Performance-based test methods for material flammability	355
	12.1 Introduction	355
	12.2 Testing and ranking systems	356
	12.3 Performance-based test methods	362
	12.4 End-use scenarios, critical conditions and controlling processes	366

12.5	Models for calculating upward flame spread and fire growth	368
12.6	Conclusions and recommendations	374
	References	375
13.	Fire safety design requirements of flame-retarded materials	378
13.1	Introduction : drawbacks of tests and methods	378
13.2	Some fundamentals	382
13.3	Selection of materials as part of the design process	386
13.4	Conclusions	394
	References	395
14.	Mathematical modelling	398
14.1	Introduction	398
14.2	A basic model for single-step pyrolysis	399
14.3	Extensions of the simple model	407
14.4	Ignition	415
14.5	Discussion	418
	References	420
	Index	425
