FOREWORD	xiii
PREFACE	xiv

CHAPTER 1

ROTATING WINGS IN STEADY FLIGHT

1.1. The Actuator Disc	
1.1.1. Simple momentum theory in axial flight	1
1.1.2. Patterns of flow in axial flight	6
1.1.3. The actuator disc in general flight	15
1.1.4. Performance of the ideal helicopter	18
1.2. The Real Rotor	
1.2.1. The rotor as a rotating machine	23
1.2.2. General momentum theory of the rotor in axial flight	25
1.2.3. Simple blade element theory	29
1.3. Rotor Performance	
1.3.1. Short methods of performance analysis	34
1.3.2. Tabular methods of performance analysis	44
1.3.3. Drag/lift ratio of helicopter rotors	51
1.3.4. Aerodynamic relations	55
1.4. Aerodynamic Problems	
1.4.1. Blade profiles	58
1.4.2. Blade stall	60
1.4.3. Propulsive force	64
1.4.4. Compressibility	65
1.4.5. Various problems	68
1.5. Rotor Analysis	
1.5.1. Vortex theory in axial flight	70
1.5.2. Vortex theory in general flight	73
1.5.3. Strip analysis in axial flight	75
1.5.4. Ground effect	82
1.5.5. Strip analysis in axial autorotation	84

CHAPTER 2

PERFORMANCE OF HELICOPTERS

2.1. Performance of Rotorcraft Elements	
2.1.1. Lifting rotor systems	89
2.1.2. Non-lifting structures	92
2.1.3. Fixed lifting surfaces	95
2.1.4. Propulsion systems	96

CONTENTS

2.2. Performance of Power Units	
2.2.1. Piston engines	98
2.2.2. Transmission and installation	101
2.2.3. Gas turbines	103
2.2.4. Pressure jet systems	104
2.2.5. Tip motor systems	108
2.3. Application of Performance Analysis	
2.3.1. Significance of design analysis	110
2.3.2. Aerodynamic design for hovering	112
2.3.3. Aerodynamic design for cruising	116
2.3.4. Aerodynamic limitation of forward speed	119
2.3.5. Presentation of performance information	121

CHAPTER 3

DYNAMICS OF THE ROTOR

3.1. Fundamentals of Blade Dynamics	
3.1.1. Dynamic model of the rotor	129
3.1.2. Elementary forces on a blade element	130
3.1.3. Air velocity components	135
3.1.4. Regrouping of elementary force components	137
3.1.5. Integration of aerodynamic forces	141
3.1.6. Integration of dynamic forces	152
3.2. Motion of Rigid Blades	
3.2.1. Flapping motion	158
3.2.2. Lagging motion	168
3.2.3. Feathering motion	172
3.3. Loads and Deformations of Flexible Blades	
3.3.1. Bending in flapping plane	175
3.3.2. Bending in lagging plane	186
3.3.3. Twist about feathering axis	189
3.4. Rotor Forces and Derivatives	
3.4.1. Summation of hinge forces	192
3.4.2. Rotor derivatives	197
3.4.3. Control system derivatives	207
3.5. Rotor Systems	
3.5.1. Variants of the fully articulated rotor	210
3.5.2. Coupling of hinge motions	214
3.5.3. Partly hinged rotors. The see-saw rotor	218
3.6. Rotor Vibrations	
3.6.1. Properties of vibrating systems	225
3.6.2. The rotor as a vibrating system	229
3.6.3. Rotor vibration phenomena	232

CONTENTS
CHAPTER 4

MECHANICS OF HELICOPTER FLIGHT

4.1. Principles of Helicopter Control	
4.1.1. Function and terminology	246
4.1.2. Control system specification	248
4.1.3. Stability and interaction in control systems	251
4.2. Stability of Free Single-rotor Helicopter with Hinged Rotor	
4.2.1. Introduction to helicopter stability	253
4.2.2. Dynamic model of the helicopter	254
4.2.3. Conceptions of free motion analysis	255
4.2.4. Derivatives of the helicopter	259
4.2.5. Dynamic stability in hovering	268
4.2.6. Dynamic stability in translational flight	272
4.3. Control of Single-rotor Helicopter with Hinged Rotor	
4.3.1. Control and trim in translational flight	275
4.3.2. Response to control impulses	282
4.4. Control and Stability of Single-rotor Helicopters with Modified Rotor Systems	
4.4.1. Modified hinged rotor system	289
4.4.2. Theory of automatic stabilisation	290
4.4.3. Integral rotor stabilisers	295
4.4.4. Control system stabilisers	299
4.4.5. Rigid rotors	301
4.5. Control and Stability of Multi-rotor Helicopters	
4.5.1. Tandem-rotor systems in hovering	301
4.5.2. Interference in tandem-rotor systems	304
4.5.3. Control of multi-rotor systems	311
4.6. Problems in the Mechanics of Flight	
4.6.1. Power-off flight	313

CHAPTER 5
HELICOPTER PROJECTS

5.1. Design Requirements	
5.1.1. Introduction	316
5.1.2. Static strength	318
5.1.3. "Fatigue proofing"	323
5.1.4. Handling in normal flight	326
5.1.5. Behaviour in critical states	328
5.1.6. Various requirements	330

CONTENTS

5.2. Quality Criteria	
5.2.1. Performance and efficiency	331
5.2.2. Ease of piloting	336
5.2.3. Operational qualities	338
5.3. Classification of Configurations	
5.3.1. Rotor drive	341
5.3.2. Number of rotors	345
5.3.3. Torque balance	347
5.3.4. Control methods	351
5.3.5. Propulsion	354

CHAPTER 6

ROTORCRAFT COMPONENTS AND ASSEMBLIES

6.1. Lifting Rotor Blade	
6.1.1. General requirements	356
6.1.2. Aerodynamic design	357
6.1.3. Mass distribution	358
6.1.4. Elastic properties	361
6.1.5. Strength criteria	363
6.1.6. Structural design	365
6.2. Articulation and Hub of Lifting Rotor	
6.2.1. Rotor systems	371
6.2.2. Hinges and links	378
6.2.3. Drag dampers	382
6.2.4. Rotor hub and mounting	384
6.2.5. Hub controls	385
6.3. Power System	
6.3.1. Tail rotors	392
6.3.2. Power transmissions	393
6.3.3. Power plants	399
6.4. Handling System	
6.4.1. Cockpits	405
6.4.2. Instruments	407
6.4.3. Control transmissions	409
6.5. Structure	
6.5.1. Undercarriages	415
6.5.2. Airframes	419
6.5.3. Payload accommodation	420
6.5.4. Equipment	422
BIBLIOGRAPHY OF REFERENCES	425
INDEX	429
