About the companion website xvii

1 Introduction **1**
1.1 Sensometrics 1
1.2 Sensory tests and measurements 1
1.3 A brief review of sensory analysis methodologies 2
1.4 Method, test, and measurement 3
1.5 Commonly used discrimination methods 3
1.6 Classification of sensory discrimination methods 5

2 Measurements of sensory difference/similarity: Thurstonian discriminal distance **8**
2.1 Measurement of sensory difference/similarity 8
2.2 Thurstonian discriminal distance, δ or d' 9
2.3 Variance of d' 14
2.4 Tables and R/S-Plus codes for d' and variance of d' 17
2.5 Computer-intensive approach to Thurstonian models of the "M + N" test 25
2.6 Estimates of population and group d' 31

3 Measurements of sensory difference/similarity: area under ROC curve in Signal Detection Theory **42**
3.1 Area measure of sensory difference/similarity 42
3.2 ROC curve functions 45
3.3 Estimations of the parameters of ROC curves 47
3.4 Estimations of variances of estimators 49
3.5 R/S-Plus codes for estimations of parameters for the three ratings methods 53
3.6 Estimates of population R-index in replicated ratings 58

4 Difference testing **60**
4.1 Binomial model for difference testing 60
4.2 Difference tests using forced-choice methods 61
4.3 Power analysis for tests for one proportion 65
4.4 Discrimination tests using methods with response bias 70

4.5 Power analysis of tests for two proportions 79
4.6 Efficiency comparisons of difference tests 87
4.7 Difference tests for d' and R-index 92

5 Similarity (equivalence) testing 98
5.1 Introduction 98
5.2 Similarity tests using the Two-Alternative Forced Choice (2-AFC) method 99
5.3 Similarity testing using forced-choice methods 105
5.4 Similarity tests using methods with response bias 114
5.5 Similarity tests using ratings of the A–Not A, Same–Different, and A–Not AR 119
5.6 Similarity tests for continuous data 122
5.7 Similarity tests for correlated data 127
5.8 Confidence interval for similarity evaluation 132
5.9 Controversy over similarity (equivalence) tests in statistical and sensory literature 136

6 Bayesian approach to discrimination tests 139
6.1 Introduction 139
6.2 One-proportion two-sided tests 140
6.3 One-proportion one-sided tests 148
6.4 Two-proportion tests 155
6.5 Thurstonian d' for Bayesian estimate of proportion 161

7 Modified discrimination tests 162
7.1 Modified Triangular test 162
7.2 Degree of Difference test 171
7.3 Double discrimination tests 177
7.4 Preference tests with a "no preference" option 186
7.5 Discrimination tests with pseudo-correct responses (forgiveness) 196

8 Multiple-sample discrimination tests 202
8.1 Multiple-sample comparison based on proportions 202
8.2 Multiple-sample comparison based on ranks 208
8.3 Multiple-sample comparison based on categories 221
8.4 Multiple-sample comparison based on ratings 231
8.5 Multiple-sample comparison based on paired comparisons 237

9 Replicated discrimination tests: beta-binomial model 255
9.1 Introduction 255
9.2 BB distribution 257
9.3 Estimation of the parameters 258
9.4 Applications of the BB model in replicated tests 264
9.5 Testing power and sample size 277

10 Replicated discrimination tests: corrected beta-binomial model 283
10.1 Introduction 283
10.2 CBB distribution 283
10.3 Estimation of parameters in the CBB model 288
10.4 Statistical testing for parameters in a CBB model 292
10.5 Testing power and sample size 295
10.6 CBB and Thurstonian models for replicated discrimination methods 298

11 Replicated discrimination tests: Dirichlet–multinomial (DM) model 301
11.1 DM distribution 301
11.2 Estimation of the parameters of a DM model 304
11.3 Applications of the DM model in replicated ratings and discrimination tests 306
11.4 Testing power for DM tests 321
11.5 DM model in a meta-analysis for usage and attitudinal (U & A) data 324

12 Measurements of sensory thresholds 329
12.1 Introduction 329
12.2 Standard dose–response model 330
12.3 Model for responses with an independent background effect 335
12.4 Model for overdispersed responses 340

13 Measurements of sensory risk with negative sensory effects 345
13.1 Benchmark dose methodology 345
13.2 Estimation of BMD from quantal data 346
13.3 Estimation of BMD from replicated quantal data 352
13.4 Estimation of BMD from continuous data 356

14 Measurements of time intensity 365
14.1 Introduction 365
14.2 Smoothing and graphical presentation of T-I data 365
14.3 Analysis based on parameters of smoothed T-I curves 369
14.4 Multivariate data analysis for T-I data 371
14.5 Functional data analysis for T-I data 375

15 Measurements of sensory shelf life 398
15.1 Introduction 398
15.2 Determination of SSL using R package and R codes 402
15.3 Numerical examples 403

16 Measurements of the performance of a trained sensory panel and panelists 412
16.1 Criteria for assessing performance 412

16.2 Estimations of ICC from different types of data 415
16.3 Statistical tests for ICCs 429
16.4 Other indices for evaluation of panel data 432
16.5 Assessing the discriminability of trained sensory panelists and panels 438

17 Measurements of consumer emotions and psychographics 444
17.1 Introduction 444
17.2 Measurements of consumer positive and negative emotions 444
17.3 Psychographics 449
17.4 Propensity score analysis 456

18 Measurements of the relative importance of attributes 463
18.1 Introduction 463
18.2 Determination of the relative importance of attributes based on averaging over orderings 465
18.3 Determination of the relative importance of attributes based on variable transformation 471
18.4 Determination of the relative importance of attributes based on Breiman's RF 474
18.5 Determination of the relative importance of attributes based on fuzzy measures and the Choquet integral 476
18.6 Meta-analysis of the relative importances of attributes 481
18.7 Adaptive penalty analysis combining both directional effects and the relative importance of JAR attributes to overall liking 482

Appendix A List of R/S-Plus codes, data files, and packages used in the book 486
