Introduction	1
The Chemistry of lignocellulosic materials from agricultural wastes in relation to processes for increasing their biodegradability	3
Changes in the physical / chemical structures of cell walls during growth and degradation	13
Optimal degradation of lignocellulosic feeds by ruminants and in vitro digestibility tests	21
Effect of fungal treatment of lignocellulosics on biodegradability	35
Improvement of olive cake and grape by-products for animal nutrition	45
White rot fungi and mushrooms grown on cereal straw : aim of the process, final products, scope for the future	55
Composition of the non-starchy polysaccharides of protein extraction residues from legume seeds	63
Protein hydrolysates and rumen fermentations	71
Organosolv treatment of wood and annual plants : application of final products	75
Cellulose degradation : concentrated acid hydrolysis processes : application of the final products	85
The fractionation of lignocellulosics for the production of chemicals	89
Shuttle HCl process for the preparation of oligosaccharides containing products from wood	97
The Common Agriculture Policy and new uses for lignocellulosic material	103
Discussion	107
Recommendations	115
List of participants	119
