

CONTENTS

Preface	vii
1. Modelling and Application of Downstream Processing : A Survey of Innovative Strategies	1
EXTRACTION AND MEMBRANE PROCESSES	
2. Statistical Thermodynamics of Aqueous Two-Phase Systems	38
3. Theoretical Treatment of Aqueous Two-Phase Extraction By Using Virial Expansions : A Preliminary Report	53
4. A low-Cost Aqueous Two-Phase System for Affinity Extraction	71
5. Separation of Proteins by using Reversed Micelles	87
6. Enzymes in Liquid Membranes : Reaction and Bioseparation	108
7. Pilot-Scale Membrane Filtration Process for the Recovery Of an Extracellular Bacterial Protease	130
PROCESSES USING BIOSPECIFIC INTERACTION WITH PROTEINS	
8. Complexation Between Poly (dimethyldiallylammonium chloride) And Globular Proteins	158
9. Protein Fractionation by Precipitation with Carboxymethyl Cellulose	165
10. Protein Separation via Affinity-Mediated Membrane Transport	188
11. Affinity Precipitation of Avidin by Using Ligand-Modified Surfactants	212
12. Ultracentrifugation as a Means for the Separation and Identification of Lipopolysaccharides	238
13. Removal and Inactivation of Viruses by a Surface-Bonded Quaternary Ammonium Chloride	250

14. Mathematical Model of A Rotating Annular Continuous Size Exclusion Chromatograph	268
15. The Continuous Rotating Annular Electrophoresis Column : A Novel Approach to Larg-Scale Electrophoresis	285
