

CONTENTS

PART I STATISTICAL BACKGROUND FOR PROCESS ANALYSIS

1. Introduction	3
2. Probability distribution and sample statistics	10
3. Statistical inference and applications	49

PART II DEVELOPMENT AND ANALYSIS OF EMPIRICAL MODELS

4. Linear models with one independent variable	105
5. Linear models with several independent variables	143
6. Nonlinear models	176
7. Identification of the best model (s)	208
8. Strategy for efficient experimentation	230

PART III ESTIMATION USING MODELS BASED ON TRANSPORT PHENOMENA

PRINCIPLES

9. Parameter estimation in process models represented by ordinary differential equations	295
10. Parameter estimation in models containing partial differential equations	330
11. Parameter estimation in transfer functions	354
12. Estimation in the frequency domain	374

APPENDIX

13. Concepts of probability	400
14. Mathematical tools	401
15. Tables	423
16. Notation	449
Author index	457
Subject index	459
