

## CONTENTS

Preface to the first German Edition	xi
Preface to the English Edition	xv
Introduction	xvii
General Literature Survey	xxiii
Terminology	xxvii
<b>CHAPTER 1 MASS AND ENERGY BALANCES</b>	<b>1</b>
§ 1.1. Mass and energy—the material balance	1
§ 1.2. The composition of mixtures and the mixing (lever) rule	5
§ 1.3. Representation of two- and three-component systems	10
§ 1.4. Determination of mixture composition using the lever rule	13
§ 1.5. Which unit: kg, kmole, or Nm <sup>3</sup> ?	14
§ 1.6. The CGS, technical, SI, and English–American systems of units	16
§ 1.7. Units of pressure, energy, and power. Standard conditions	19
§ 1.8. Dimensionally homogeneous and dimensional equations	23
§ 1.9. Internal energy and enthalpy	26
*§ 1.10. Notes on dealing with partial derivatives	29
§ 1.11. Heat capacity and specific heat	35
§ 1.12. The $h$ - $w$ diagram and the lever rule for adiabatic mixing	38
§ 1.13. The energy balance and energy flow diagram	42
§ 1.14. Introduction to heat transfer	43
§ 1.15. The heat exchanger	47
<b>CHAPTER 2 CONCEPT AND USE OF ENTROPY</b>	<b>53</b>
§ 2.1. Ordered and disordered energy	53
§ 2.2. The differential $dS$ of the entropy is an exact differential	64
§ 2.3. Changes of state	69
§ 2.4. Phase diagrams	73
§ 2.5. The reciprocating compressor	84
§ 2.6. Thermodynamic mean temperature	90
§ 2.7. Availability in steady flow or exergy	91
§ 2.8. What work can be produced theoretically and practically on combustion?	99
§ 2.9. The exergy flow diagram	106
§ 2.10. Efficiency, performance coefficient, and reversibility	107
§ 2.11. Refrigerating plants and heat pumps	108
§ 2.12. First example of a thermodynamic analysis: evaporation of salt solutions	119
§ 2.13. Second example of a thermodynamic analysis: liquefaction of air	126
§ 2.14. Thermodynamics and economy	133
*§ 2.15. Unsteady processes	135
<b>CHAPTER 3 PROBABILITY THEORY AND THE KINETIC THEORY OF GASES</b>	<b>139</b>
§ 3.1. Introduction to probability theory	139
§ 3.2. Law of large numbers	141
§ 3.3. Primitive model of a highly diluted gas	143
§ 3.4. Mixtures of ideal gases	146
§ 3.5. Equilibrium, equipartition theorem, and an introduction to the theory of specific heats	148

§ 3.6. Distribution functions	159
§ 3.7. The Earth's gravitational field as a "velocity sieve"	163
*§ 3.8. Calculation of Maxwell's velocity distribution function in one direction from the barometric height formula	164
§ 3.9. Maxwell's velocity distribution law in three directions	170
§ 3.10. The Boltzmann factor	175
§ 3.11. Number of wall collisions and the rate of evaporation	187
§ 3.12. The mean free path	190
§ 3.13. Viscous flow, heat conduction, diffusion	193
§ 3.14. Viscosity, thermal conductivity, and diffusivity in an ideal gas	199
§ 3.15. Transport processes in case of a large mean free path	205
§ 3.16. Brownian movement, limits of measurement accuracy, and fluctuations	209
*§ 3.17. Diffusion and the binomial coefficients	213
§ 3.18. Error function	217
§ 3.19. Entropy, disorder, and probability	223
<b>CHAPTER 4 PHYSICS OF SOLIDS</b>	<b>227</b>
§ 4.1. Ordered and disordered structure	227
§ 4.2. Forces and stresses	228
§ 4.3. Vectors and scalars	230
*§ 4.4. The stress tensor	231
§ 4.5. The stress-strain diagram	234
§ 4.6. The generalized Hooke's law	238
§ 4.7. Relations between the elastic constants of isotropic bodies	239
§ 4.8. Creep strength	240
§ 4.9. Safety factor	241
§ 4.10. Permissible internal pressure for thin-walled pipes and containers	242
§ 4.11. Stress distribution in a thick-walled pipe	244
§ 4.12. Design precautions for relieving non-uniform stress distributions in a thick-walled pipe	247
§ 4.13. The flat plate resistance to bending	250
§ 4.14. Shells	254
§ 4.15. Theories of fracture	255
§ 4.16. Internal and external notches	256
§ 4.17. Shape errors and roughness of technical surfaces	260
§ 4.18. Bulging and denting	262
§ 4.19. Model laws of mechanics	264
§ 4.20. Thermal stresses	267
§ 4.21. Work capacity of solids	270
*§ 4.22. Yield condition of von Mises, based on the distortion energy	272
*§ 4.23. Reversible temperature changes during the elastic elongation of solids	274
*§ 4.24. Anisotropy	277
<b>CHAPTER 5 BODIES WITH A LARGE SURFACE AREA AND FINELY DISTRIBUTED MATERIALS</b>	<b>283</b>
§ 5.1. Possible structures	283
§ 5.2. Survey of the order of magnitude of particles	286
§ 5.3. Specific surface and shape factors	289
§ 5.4. Porosity	292
§ 5.5. Mean particle size	293
§ 5.6. Specific surface and rates of transport processes	294
§ 5.7. Operations of hard crushing	299
§ 5.8. Particle and drop-size distribution functions	301
§ 5.9. Surface tension and energy efficiency in atomization	309
§ 5.10. The work and energy efficiency of size reduction	314
§ 5.11. Piles, fills, packings, and packed beds	317

§ 5.12. Surface development and porosity of fixed beds and capillary systems	319
§ 5.13. Conduction processes in a heterogeneous body	320
<b>CHAPTER 6 PRINCIPLES OF FLUID DYNAMICS</b>	<b>325</b>
§ 6.1. Principles of fluid dynamics	325
§ 6.2. The continuity equation for flow in pipes	328
*§ 6.3. The continuity equation for the "volume element" and the divergence	330
*§ 6.4. The general concept of flow	334
*§ 6.5. Flows with sources	340
*§ 6.6. The Gauss integral law	342
*§ 6.7. The velocity potential	343
§ 6.8. Model tests are necessary	344
§ 6.9. The acting forces	345
§ 6.10. The conditions of model similarity	347
§ 6.11. Liquids at rest and Pascal's law	351
§ 6.12. Static pressure of columns of liquid and pressure head	351
§ 6.13. The laws of energy and momentum	352
§ 6.14. Acceleration in non-steady flow	354
§ 6.15. Stream lines and flow paths	357
§ 6.16. The Bernoulli equation	358
§ 6.17. Viscosity and the Newtonian fluid	361
§ 6.18. The viscous force acting on a "volume element" and the Navier-Stokes equations	363
§ 6.19. The energy balance of a flow without chemical reaction	365
§ 6.20. The energy balance of a flow with chemical reaction	368
§ 6.21. The entropy balance of flow	369
§ 6.22. Flow through nozzles and orifices	371
§ 6.23. The Mach number	376
<b>CHAPTER 7 APPLICATION OF FLUID DYNAMICS</b>	<b>379</b>
§ 7.1. Deductions based on Newton's viscosity law	379
§ 7.2. Flow in a pipe and the critical Reynolds number	382
§ 7.3. Formulae for the pressure drop in smooth and rough pipes	384
§ 7.4. Velocity distribution over the pipe cross-section	389
§ 7.5. The hydraulic diameter	392
§ 7.6. Design of gas pipelines for pressure and vacuum	394
§ 7.7. Frictionless liquids	401
§ 7.8. Orifices at outlet	401
§ 7.9. Flow measurement with nozzles and orifices	404
§ 7.10. Variable-area meters	407
§ 7.11. The Pitot tube and the Prandtl impact tube	410
§ 7.12. Summary of flow measurement methods	413
§ 7.13. Pressure drop in fittings	417
§ 7.14. Some applications of the law of momentum	418
§ 7.15. The boundary layer	423
§ 7.16. Flow separation and eddy formation	428
§ 7.17. Instability of the separating surface	430
§ 7.18. Mixing—diffusion—reaction	431
§ 7.19. The free jet	435
§ 7.20. Flow past a body	436
§ 7.21. The Froude number	439
§ 7.22. Mixing of liquids in stirred tanks	440
*§ 7.23. Mean residence time, residence time distribution and transition function	445
§ 7.24. Falling films	458
§ 7.25. Forces in rotating systems	461

§ 7.26. Vortex and cyclone	464
§ 7.27. Some data on turbomachinery	466
§ 7.28. Comparison of design principles of pumps and compressors	475
*§ 7.29. Water hammer	482
§ 7.30. Cavitation and expansion evaporation	486
§ 7.31. Brief notes on magnetohydrodynamics	488
<b>CHAPTER 8 DIMENSIONAL ANALYSIS AND MODEL THEORY</b>	<b>493</b>
§ 8.1. Dimensions	493
§ 8.2. Primitive application of dimensional analysis	498
§ 8.3. Dimensionless numbers	501
§ 8.4. The $\Pi$ -theorem	506
§ 8.5. The dimensionless equations of incompressible, heavy, inert, and viscous liquids	509
§ 8.6. Derivation of dimensionless groups by division of types of properties with equal dimensions	514
§ 8.7. Derivation of equation for the Carnot cycle by means of dimensional analysis	517
§ 8.8. The number of basic or fundamental properties	519
§ 8.9. Limits and appraisal of dimensional analysis	523
§ 8.10. The derivation of the similarity laws from the differential equations	525
*§ 8.11. Dimensionless groups for molecular gases	531
§ 8.12. Dimensional analysis—similarity laws—model technique	534
§ 8.13. The way from the idea to the full-size plant	535
§ 8.14. Possibilities and limits of model tests	538
§ 8.15. Wall effects	541
§ 8.16. Analogue methods	541
§ 8.17. Summary	547
<b>CHAPTER 9 HEAT, MASS, AND MOMENTUM TRANSFER</b>	<b>549</b>
§ 9.1. Reversible and irreversible thermodynamics	549
§ 9.2. Examples of mass transfer processes	552
§ 9.3. Basic equations and definitions	557
*§ 9.4. Other definitions of the mass transfer coefficients	561
§ 9.5. The dimensionless numbers important in heat transfer	566
§ 9.6. The dimensionless numbers important in mass transfer	568
§ 9.7. The model of turbulent transfer	569
§ 9.8. Relations derived from the model of turbulent transfer	573
§ 9.9. Transfer in the laminar sublayer	574
§ 9.10. Simultaneous treatment of the resistance in the turbulent core and in the laminar sublayer	576
§ 9.11. Graphical determination of the Nusselt number for forced convection in pipes	579
§ 9.12. Influence of pipe length	581
§ 9.13. The temperature profile in pipes as a function of the Prandtl number	582
§ 9.14. The equivalent diameter for heat transfer	583
§ 9.15. Calculation of the temperature profile in heat exchangers and the mean temperature difference	586
§ 9.16. Heat and mass transfer in the case of flow past a single body	589
§ 9.17. Heat and mass transfer in the case of steady-state free convection	593
§ 9.18. Application and limits of the analogy between momentum, heat, and mass transfer	598
§ 9.19. Suggestions for the calculation of heat exchangers	600
§ 9.20. Heat transfer with simultaneous change of phase	606
§ 9.21. Heat transfer in condensation	607
§ 9.22. Deviations from the Nusselt water-film theory	612
§ 9.23. Heat transfer in boiling	614
§ 9.24. The problem of bubble formation	620
§ 9.25. Theories of nucleate boiling	625

§ 9.26. Heat transfer in solidification	626
§ 9.27. Non-steady heat conduction and diffusion	628
§ 9.28. Integration of equations for non-steady heat flow and diffusion according to the point-source method	632
§ 9.29. Non-steady heat flow in an "infinitely thick" plate	635
§ 9.30. Calculation of the overall mass transfer coefficient	640
§ 9.31. Transfer at fluid-fluid interfaces	645
§ 9.32. Means of attaining high heat fluxes	647
§ 9.33. Transpiration and ablation cooling	649
§ 9.34. Heat radiation	650
§ 9.35. Reference values for heat transfer coefficients and heat fluxes	651
§ 9.36. Systematic study of transport processes	652
<b>CHAPTER 10 MULTIPHASE FLOW PROCESSES</b>	<b>657</b>
§ 10.1. Survey of the field	657
§ 10.2. The characteristic quantities	660
§ 10.3. Flow past single bodies	663
§ 10.4. Settling and centrifuging	669
§ 10.5. Separation by sedimentation	672
§ 10.6. Flow through fixed beds	674
§ 10.7. Filtration	679
§ 10.8. Fluidized beds	682
§ 10.9. Pneumatic transport	686
*§ 10.10. Similarity criteria for gaseous flow dispersions	690
§ 10.11. Two fluid phases	696
§ 10.12. Gas bubbles rising in a liquid	702
§ 10.13. The production of bubbles by the slow introduction of gases into liquids	710
§ 10.14. Bubble chains	713
§ 10.15. Two-phase flows in pipelines; survey and basic relations	715
§ 10.16. Flow patterns	720
§ 10.17. Pressure drop and calculation of gas-lift pumps	723
§ 10.18. Two-phase flow past bodies of irregular shape	727
§ 10.19. Atomization	728
§ 10.20. Emulsification and dispersion of gases in liquids	736
§ 10.21. Foams	739
<b>CHAPTER 11 RHEOLOGY</b>	<b>743</b>
§ 11.1. Survey of the field	743
§ 11.2. Phenomenological macrorheology	745
§ 11.3. Models of rheological bodies	749
§ 11.4. Molecular-kinetic interpretations of rheological behaviour	752
§ 11.5. Flow of rheological bodies through pipelines	753
§ 11.6. Pressure and flow of particulate material in hoppers	757
<b>CHAPTER 12 CONCLUDING REMARKS</b>	<b>761</b>
§ 12.1. Introduction	761
§ 12.2. The three stages of reaction kinetics	761
§ 12.3. Type of operation and residence time	763
§ 12.4. Contact between mass flows	767
§ 12.5. Counterflow as an amplification principle	769
§ 12.6. Equilibrium curve and operating line	773
§ 12.7. The theoretical plate	782
§ 12.8. The ideal stage and the transfer unit	785
§ 12.9. Stability and instability of a reactor	789
§ 12.10. Falling and rising characteristics	791
§ 12.11. "Kipp" oscillations	793

§ 12.12. Hysteresis	795
§ 12.13. Flip-flop and memory	800
§ 12.14. Time-lag and damping	801
§ 12.15. Optimization	804
§ 12.16. Laws of conservation	811
§ 12.17. Temperature and pressure ranges	815
§ 12.18. Concluding remarks	817
Appendix 1 Solutions to Problems	819
Appendix 2 Dimensionless Numbers	861
Name Index	863
Subject Index	877
Other Titles in the Series	897
