

CONTENTS

Introduction	1
Pretreatment of lignocellulosics for edible fungi	3
Practical problems in the pretreatment of straw-based lignocellulosic substrate for <i>Pleurotus</i> production	14
Significance of microorganisms in the composting process for cultivation of edible fungi	21
Methods and application of fungal biomass measurement in solid substrates	31
Production, characterization and mechanism of lignin peroxidases	37
Production and function of enzymes during lignocellulose degradation	43
Selection and screening of white-rot fungi for delignification and upgrading of lignocellulosic materials	50
Microbiological improvement of lignocellulosics in animal feed production-a review	56
Principles of solid state fermentation	64
A 352-liter fermenter for solid state fermentation of straw by white-rot fungi	77
Bioreactor for the cultivation of microorganisms of lignocellulosic materials	90
Compost treatment in bulk for mushroom growing	99
Solid state fermentation of wheat straw by <i>Cyathus stercoreus</i> for improvement of feed value for ruminants	105
Conclusions and recommendations	115
List of Participants	119
